TORONTO.—There is a feeling of optimism throughout the trade generally, but while everyone is absolutely convinced that good times are ahead, they feel they are coming gradually and cannot be rushed in any way. In fact, it is the general opinion that more benefit will come if the improvement is gradual and steady.

One dealer expressed the view that small tools, etc., were just the same as last week. He claims business is dull at present, but that things were in line for an improvement. Prices remain where they have been in the machine tool market, but there is a feeling that things are on the up-grade. In fact, one dealer stated that business looked very much better, and that there appeared to be a better feeling than there was last week. Quite a number of enquiries had been received during the last month. Actual business, however, is not so well advanced, as most people appear to be mostly writing for prices, etc. The general feeling, however, is that conditions will gradually improve from now on. Ontario is in a much better position than other provinces, and there are more enquiries and actual buying here than in any other province. American concerns locating here expect to do considerable business, and look favorably on the exchange rate, buying chiefly in Canada. They get much better value for their money, with the exception of special lines, some of which are not even procurable in this country. There is a marked tendency all over to enquire regarding machinery and equipment. Rebuilt or used machinery is in preference at present.

### Steel Situation

Prices remain practically the same as last week. Conditions in other parts of Ontario are better than in the city here, remarks one dealer. Interest is very keen regarding the U. S. Steel Corporation, one gentleman stating that he was practically waiting for a reduction every hour. "When a cut does come," he said, "it will be a substantial one." Prices are being received from the independents that are much lower than corporation prices. As one dealer put it: "They are playing an old game, but it's too old to put over. It is only a question of time before they will have to give in." Another gentleman had this story to tell: "Prices and conditions are exactly the same as last week." Speaking of a possible reduction in U.S. Corporation prices he remarked that he would not even predict 48 hours ahead at the present time.

### The Scrap Market

"Absolutely no change in the prices of scrap iron or pig." Briefly, this describes the situation. There is a distinct glut of metals of all kinds on the market, and according to one dealer, prices can hardly be lower than they are are present. To his mind this is the proper time to buy. The steel and freight situation is demanding considerable attention and thought among those in the metal industry. When conditions get back to normal, some dealers claim that metals will be harder to get and more expensive. Practically all the larger plants have banked their furnaces, and only a very small percentage are operating to capacity.

A point that is retarding everything, according to one dealer, is the labor

situation in the United States. This, of course, is the dispute between the unions and the open shop. They all consider that Canada is 100 per cent. better placed as regards labor than the United States and that Quebec is perhaps best of any province in this respect. Despite continued dullness, everybody is optimistic. Improvement is looked for round the middle or end of May. Taken in all conditions are better than they were last week.

# IMPROVEMENT IN DEMAND LOOKED FOR WITHIN THE NEXT FEW WEEKS

Special to CANADIAN MACHINERY.

PITTSBURG, March 10.—Surface developments in the iron and steel market are meagre and of no particular importance, but under the surface important things are working out.

Demand continues stagnant. The independents are booking scarcely any business with their cut prices. The Steel Corporation is not booking much business, but it is booking some. Its bookings are not due to its price or to the service it can render, as the independents will make lower prices and can give fairly prompt shipment. The corporation can usually beat the independents in promptness of shipment by a small margin, as the corporation has all kinds of departments in operation, while with an independent the shipment must frequently wait until enough orders accumulate to start the department involved. The chief reason the corporation is booking business is that consumers wish to secure, or retain, a place on its order books, after the spectacular example in 1920 of how much saving there was in having an allotment by the corporation.

### Operations

The common estimate is that the independents are not operating at over 20 or 25 per cent. of capacity. In January they operated at 25 or 30 per cent. The Steel Corporation's operations have dropped to about 60 per cent. against fully 90 per cent. early in January. Some decrease was certain to come, even if the price situation had not been disturbed, since the corporation's customers were in many cases receiving much more steel than they could distribute or consume, but the price-cutting by independents has sharply accentuated the decrease, causing many corporation customers to instruct the corporation to curtail or discontinue shipments. There is not much cancellation, however, and there is no buying from independents as a substitute.

The steel industry as a whole is operating at about 40 per cent. of capacity, against an average of 80 per cent. during the first nine months of last year. After all, the present rate is rather a high one, considering both the general stagnation in business and various other circumstances. There is, for instance, the item that rail production has been curtailed of late because the railroads are unable to pay for all the rails already shipped them thus far this year.

Pig iron production now is at the rate of about 22,000,000 tons a year or at a little less than 50 per cent. of actual productive, not rated, capacity. On account of coke shortage and other difficulties the maximum rate attained last year was 40,000,000 tons, in March. Production has decreased much more by the merchant furnaces than by the steel works furnaces, being not over one-third of capacity, but the steel interests continue to curtail. The Steel Corporation is operating very much better than the independents, and of all the corporation subsidiaries the Carnegie Steel Company stands second in point of operation, yet of its 59 blast furnaces the Carnegie company at last report was operating only 38, against 48 about the middle of January, and additional furnaces are to be put out.

### Steel Prices

Minimum prices for steel products done by independents have declined very little, on the whole, in the past week. On ordinary orders bars are still quotable at 2c and shapes and plates at 2.10c, while there is less talk of its being possible to shade these prices materially in case a really good order was going. Sheets are commonly quotable at 3.20c for blue annealed, 4.10c for black and 5.25c for galvanized. These prices could be shaded on a sufficiently attractive order.

The most interesting price decline in the week is furnished by the action of the Pittsburg Steel Company in quoting wire nails openly at $3.00 per keg, base, against the regular or Steel Corporation price of $3.25. Nails were regarded as being priced very closely at $3.25, relative to other steel commodities, hence shading of the price is particularly interesting. When the Midvale Steel and Ordnance Company began cutting prices generally, about a month ago, it sold some nails at $3.10, but afterwards announced that it had withdrawn the $3.10 price. It is understood the Pittsburg Steel Company maintains that it made the $3.00 price because at least two other producers were quietly doing $3.00, although nominally quoting $3.25.

### Undercurrents in Steel

The United States Steel Corporation has not reduced its prices or wages, and no indication can be seen that it contemplates doing so in the near future. To many in the trade the Steel Corporation has seemed an enigma, and yet its action is not necessarily out of line with precedents and present conditions if these are considered carefully. Thus, it has been the steel trade practice in the past that when prices are cut by some producers others follow and in a very short time the cut prices become the general market. The present, however, is an exceptional case. The mills used to cut prices when they could get business thereby. This time they cannot and probably they knew they could not. It is commonly believed that the cutting was done with the ulterior object of securing a "redistribution" of business and forcing the Steel Corporation to reduce wages, as practically all the independents have done. But there is no redistribution of business. The corporation has lost in shipments, but that is merely postponement. The corporation has not lost customers and independents have not gotten any business away from the corporation. As to wages, obviously the corporation cannot fairly reduce wages when it has not reduced prices. Its shipments are at the old prices, why should not wages be at the old rates? So the corporation does not seem to be as much of an enigma as is commonly thought.

In the past few days there is beginning to be observed an undercurrent of the independents being less disposed to continue their price-cutting course. Perhaps they are influenced by the extremely small amount of business secured thereby, and probably they are impressed by the Steel Corporation's calm refusal to be governed. Possibly they feel that if steel prices are once gotten down they cannot be gotten up again, as used to be the case. There will necessarily be an improvement in demand in the next few weeks, and later there will be much further improvement, even to a point of there being really a large demand, according to past standards, but that is a different thing from a demand equal to the present capacity, which is 50 per cent. greater than in 1914. In the past steel prices never advanced unless the mills were operating at 85 per cent. or more.

### Pig Iron

Foundry pig iron has been quoted and sold at $26.50, valley, or 50c decline in the week. Bessemer remains nominally quotable at $27, valley, and basic at $25, valley, but one sale of a few hundred tons of basic has just been made at $23, under somewhat mysterious circumstances. If it turns out that there is more iron to be had in the same quarter the quotable market will be $23. Only four merchant furnaces in the Mahoning and Shenango Valleys are operating and some of them are thinking of going out, as they are piling up more iron than they are shipping.

---

The Hamilton Products, Ltd., has been incorporated with head office at Hamilton, Canada, and capital stock of $1,500,000, to carry on the business of iron masters, iron makers, iron and steel converters, smelters, engineers, etc.

## Pig Iron Market

The pig iron market remains very dull and a base price of $26 is now appearing. On the Philadelphia market the price of $26 Eastern Pennsylvania furnace on No. 2 plain foundry iron (1.75 to 2.25 silicon) has appeared during the past week, but only in connection with live inquiries of 500 tons or more. No. 2 (2.25 to 2.75 silicon) on large inquiries has been quoted at $27 and $27.50. An eastern consumer is inquiring for basic, but is unwilling to pay higher than $25, delivered, which is lower apparently than furnaces would do.

On the Chicago market foundry pig iron has been sold to a consumer in Wisconsin at a price which would figure back to $24 Chicago furnace for 1.75 to 2.25 silicon. This iron is for March delivery to a maker of sanitary goods and involves 2,000 tons. It is understood that this iron was sold at $26, delivered. Freight from Chicago is approximately $2. Some inquiry is coming out, one calling for 250 tons of foundry iron and another being for 500 tons of low phosphorus iron, both for Chicago users.

The pig iron market at Cleveland continues to reflect the depressed condition among the foundries and sales are light. The American Radiator Co. has been the most active buyer, particularly for Detroit, but it has not been found that it has taken much tonnage direct from the furnaces. The main lots closed for Detroit appear to have been resale iron and these obtained from various sources in the week have exceeded 1,000 tons. In some of these cases it is reported that as low as $25, Detroit, was done, but producers have been unwilling to meet this figure.

The low prices available on basic and bessemer pig iron on the Pittsburg market does not appear to bring any measurable increase in buying of the steelmaking grades. Some inquiries are before sellers, but mostly they represent only an effort of users to get a line on the market. Only a few sales are reported at $25 and $27, valley, respectively, involving from one to three carloads. The merchant interest which was first to establish the $25 and $27 levels and which reports closing on a fair proportion of the 16,000 or 17,000 tons figured on in February, states, however, that it declined a 3,000-ton order for basic offered at $25, valley, less commission. It is selling iron only to its regular customers. Intermittent sales of foundry iron continue to be made.

While actual selling of pig iron on the New York market during the week has been limited to small tonnage, inquiry has improved to some extent, and in addition to numerous small lots includes one lot of 1,000 tons, another of 800 and one of 500 tons. All of these are for quick shipment, excepting the 800-ton inquiry. There is no assurance as to when these inquiries will result in business. Foundrymen, however, are speaking more hopefully. Business prospects look better to them, and some of them that only a short time ago said they would need no more iron for a year or more are among those now inquiring. On Eastern Pennsylvania foundry iron the minimum price of the past week was $27 furnace for 1.75 to 2.25 silicon, while in some cases this iron sold as high as $30.

With the continued absence of consuming demand on the Boston market, pig iron prices in New England have shown a tendency toward a lower level during the week. A Rhode Island melter bought 100 tons of No. 2X (2.25 to 2.75 silicon) in two lots, including 50 tons from an Eastern Pennsylvania furnace at $31.75, delivered, or approximately $26.50 furnace. Foundries in general continue to melt about the same tonnage they were consuming a week ago. Prices in castings have softened.

Buffalo reports that the price on pig iron now is ranging from $28 to $30 base on sales of resale and furnace iron by furnaces. A broker sold 300 tons of No. 2 foundry (2.25 to 2.75 silicon) for $28. This is equivalent to a base price of $26.75. One interest sold about 2,000 tons, part of which was resale metal, at $28 to $29, and part of which was $30 for the straight furnace No. 2 grade (1.75 to 2.25). Malleable inquiry is light.

Lower prices have brought out but little business and melters of pig iron continue buying from hand to mouth in the Birmingham district. General quotations for pig iron are on a level of $27.50 for No. 2 foundry (1.75 to 2.25 silicon). It is reported that a 1,000 ton order was accepted under that figure and some business is known to have been closed at $26.50 base.

## Scrap Metal Market

Dullness continues in the scrap market. Prices are generally weaker, although at Boston and Buffalo heavy melting steel advances. There is no buying worth speaking of on the Chicago market. Quotations at present are lower than the level attained early in 1919, which has been the record for several years, and while the bottom seems to have been reached, experience forbids prophecy as to the future.

The situation in Boston is sufficiently encouraging to create a slightly better interest among dealers. The price range is wide as buying is largely for storage purposes. Heavy melting steel which was $9.50 the middle of February, is now better represented by $10 as the large dealers are willing to pay this price. Mills are paying $13 for rerolling rails but the future appears sufficiently encouraging to warrant some dealers paying as high as $15 for storage. Four or five cars of No. 1 machinery scrap were sold to Massachusetts consumers at prices ranging from $23 to $25, delivered, depending upon location.

New York reports that operations at the local scrap yards are somewhat better, as a result of open weather. However, they are far from active as buying continues virtually at a standstill. Heavy melting steel for eastern consumption continues at $9.50 to $10 f.o.b. New York, machine shop turnings $8.50 to $9; heavy cast $18 to $19, and machinery cast at $19 to $20.

The demand for heavy melting steel and forge scrap on the Philadelphia market has improved somewhat. Current buying involves only moderate sized tonnages, however, and the total is comparatively small.

The position of the market is weaker, though no change is registered in prices. This is due to the continued restricted operations of the Steel Corporation and the spasmodic operations of the independent companies. Where scrap is available, offers by bidders are so out of line with the idea of the producers, the latter decide to hold the scrap in their yards or bins for a rise in price.

On the Buffalo market during the past week, one mill was willing to pay $14.50 for scattered tonnages of heavy melting steel, but the top price now offered is $14. Little selling is being done and the market is really a nominal one. Mill operation has been reduced here and the scrap output is lighter.

With the exception of cast borings, a general decline in prices has taken place in the Detroit iron and steel scrap market. Heavy melting steel is down to $10.50, heavy axle turnings to $10, and machine shop turnings to $5.

The southern market is still quiet, and dealers are uncertain as to when business will improve. The largest consumer of heavy melting steel in the Birmingham district, buying on the open market, is not operating its open-hearth furnaces.

---

## UPWARD TENDENCY RECOVERY BETTER

"There is a decidedly upward tendency, whereas, one month ago, we felt that the bottom was a long way down," declared a manufacturer to Canadian Machinery. As one interested in production work in forgings and stampings, he pointed out that while the slump in that particular line had been sharp and sudden, the recovery had been much more encouraging than expected. Some firms had suspended activities so completely last fall that they had made little or nor provision for a resumption that was sure to come with spring. Hence, there has been, during the past few weeks, quite an activity in small tools and other equipment, although it must be admitted this was short lived in some departments. The feeling in many quarters is that the turn had been made to the upgrade.

Victoria Foundry Co., Limited, Ottawa, Canada

# The Week's Events in Montreal Industry

E. A. Schofield, manager of Jones and Glassco, St. Nicholas Building, Montreal, who has been on a business trip to England for the past two months, is expected back in Canada early in April.

Edmund F. Conway, president and managing-director of the St. Lawrence Foundry Company, has been elected as a member of the board of directors of Canada Foundry and Forgings, Limited. Mr. Conway has been associated with the foundry business for many years.

Reconstruction of the plant of W. R. Cuthbert & Company is progressing with rapidity and it is expected that within a few weeks they will be able to resume operations. The changes to plant and equipment will make it one of the most modern of its kind in the district, and the improved facilities will add to the efficiency of production.

In order to meet the full requirements of users of the Armstrong-Siddeley cars, the Canadian agents, the Armstrong-Whitworth Company of Canada, 298 St. James Street, Montreal, have arranged to carry a complete set of repair parts at their Montreal warehouse. They have also secured the services of an expert from the works in England, who will be entirely at the disposal of the patrons of these cars.

The shipping firm of Furness, Withy & Company has purchased the Fraser building and site in Montreal and will remodel the building or rebuild the structure in keeping with other of their offices in other world ports. Plans have not yet been completed, but it is expected that the two first floors will be reserved for the shipping firm. The site of the new offices is at the corner of St. Sacrement and St. Alexis Streets.

Mr. Th. Seidl, chief engineer of the Escher Wyss & Company, Zurich, Switzerland, who arrived in Montreal last January to look after the interests of his company in Canada, is now on a trip to the principal Ontario points as a part of the survey he is making of conditions in this country for the Escher Wyss Company. The Montreal office of the company, which has been in the Coristine Building for some years past, has been moved to the Guarantee Trust Building, 285 Beaver Hall Hill.

Announcement has been made by the Department of Naval Service that the new direction-finding radio-telegraph station at St. John, N.B., has been opened for service. This is the fourth of the kind now in use by the Naval Service on the Atlantic coast. This station will be known as the St. John station, but the actual location is on the east side of the harbor at Red Head, about four miles from the city. It will act in conjunction with the other finding stations, and in addition will serve the special needs of the Bay of Fundy, enabling ships to navigate this bay in safety in all weathers.

Walter P. Newman, secretary of the British Smelting and Refining Company, Drummond Building, Montreal, has just returned from a three months' trip to England in the interests of his company. He reports that the London organization is going strong, and brings a refreshingly optimistic viewpoint of conditions in the Old Country. Mr. Newman believes that things are on the turn for the better even though this may not yet be apparent to superficial observation. A hopeful spirit prevails in Britain, and Mr. Newman expects to see this condition of mind reflected here in actual business improvement in the very near future.

The importance and necessity of Imperial education was emphasized by Chas. R. Smith, of the London Times, at a recent meeting of the Canadian Association of British Manufacturers, held in Montreal. The theme of the address was "Think, trade and read Imperially." He stated that every home should read at least one empire magazine to keep in touch with its affairs; they should not attain that result by merely reading American journals. People did not yet realize the simplicity of it: there were many people talking of the independence of the Dominion, but now and then one should also think Imperially, and after that first step would trade Imperially.

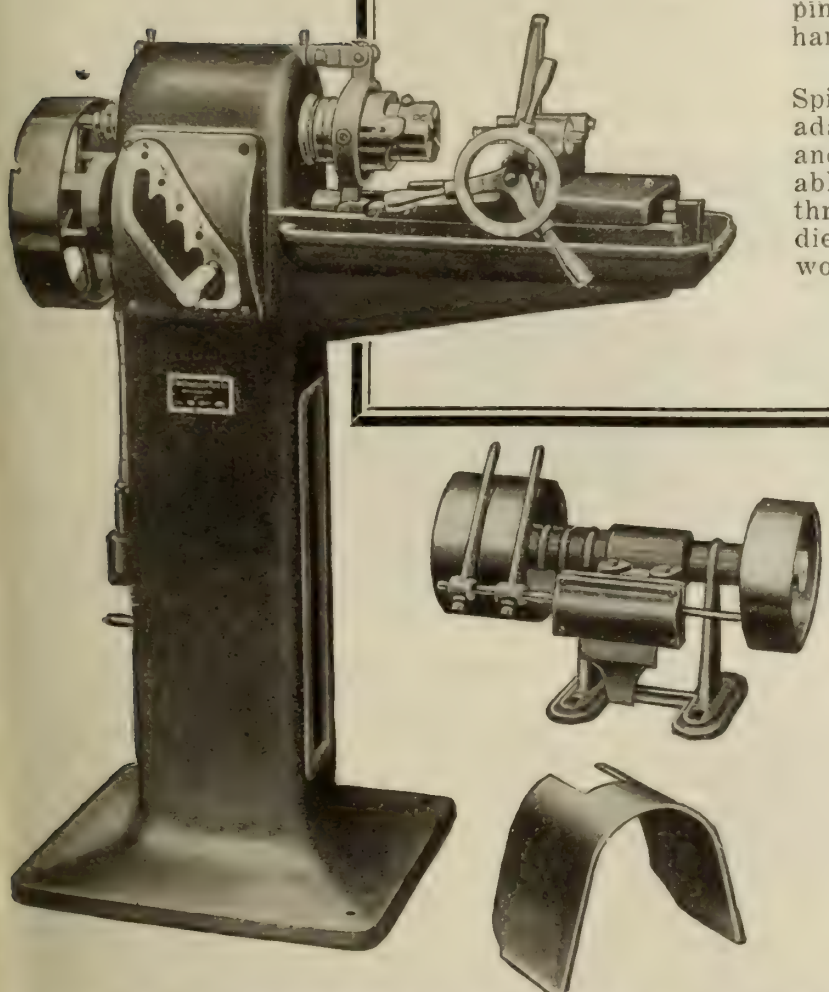
T. H. Watson & Company, of Sheffield, England, announce that arrangements have been made with the General Combustion Company of Canada, Limited, New Birks Building, Montreal, to handle, build and sell their various electric smelting, melting and refining furnaces. The Canadian rights for the "Greaves-Etchells" type of furnace, which has been widely adopted in the United States and England, France and Spain, are also included in the arrangements made. The General Combustion Company is also taking over the designs of the Electric Furnace Construction Company of Philadelphia, on the various types of electrically heated core ovens, annealing and heat-treating furnaces, and will have the active co-operation of the American company on electric furnace problems generally.

In speaking before the annual meeting of the Quebec Provincial Council of the St. John Ambulance Association last week in Montreal, Col. C. A. Hodgetts, of Ottawa, emphasized the necessity of establishing instruction classes in first aid to the injured in every factory or plant where there many employees. A resolution to the following effect was adopted at the close of the address: "That in view of the importance of first aid from an industrial standpoint, this meeting goes on record as approving the policy of organized classes of instruction in every factory or other establishment where a number of men and women are gathered together; and that regulations calling for first-aid certificates, with qualified attendants, should be incorporated in the Workmen's Compensation Act of the Province."

At the annual meeting of the shareholders of the Canada Cement Company, held last week, in Montreal, F. P. Jones, the vice-president and general manager, stated that business outlook for the coming year was more or less obscure. He thought that the activity in building trades this year would show an improvement over that of the past two years, but did not anticipate any marked boom. Summing up the prospects before his company, he stated: "I do not hold out any great hopes for an active business in cement in the near future. If our company secures enough business this year to warrant the running of our plants to within 60 per cent. of their capacity I think we shall be doing well." The company is contemplating the erection of a new ten-storey building on Phillips Square, and work on this will likely be started in the near future.

## BUSINESS BOOMING CREATES CONFIDENCE

Recent statements by company officials of the Canadian General Electric Co. to the effect that business was booming has created a fresh flurry, in so far as trading of shares are concerned. Nearly 700 shares changed hands on Saturday and for a stock of which the floating supply is known to be small, this was unusual, and seemed to indicate a good deal of faith or expectation on the part of traders. The president of the company, Senator Nicholls, having disposed of the rumor of absorption by the American General Electric, new theories for the demand were found. One who has watched the company's progress closely spoke guardedly of some favor which he expected would come to shareholders. In any case, he said the company had now orders on hand to keep the plants going for a full year.



# THIS WAY, PLEASE

Where quantity and exactness have to be considered, the Geometric Threading Machine is just the way that suits. These machines have been tested and proved over and over again on speed, accuracy and endurance.

Geometric Threading Machines are employed on a large class of small threaded parts that cannot be produced economically on the ordinary screw machine.

Made in three sizes—to cut 1/8 to 1/2 inch, 1/4 to 3/4 inch, and 3/4 to 1 1/2 inch diameter threads. The carriage is mounted on slides and on the largest size machine is moved back and forth by rack and pinion, and in the smaller sizes by hand.

Spindle speed changes readily made, adapting the machine to the diameter and material of the work. An adjustable stop assures accurate length of thread, and automatically opens the die head, permitting of drawing the work straight back.

*A line from you brings full details regarding this machine. Tell us your threading requirements—let us recommend the proper Geometric Collapsing Tap or Self-opening Die.*

# INDUSTRIAL NEWS

## NEW SHOPS, TENDERS AND CONTRACTS PERSONAL AND TRADE NOTES

## WOULD ADD REVENUE ADVOCATES 1 P.C. TAX

**Such a Tax on Business Would Be an Improvement on Present Method, According to J. F. M. Stewart.**

Speaking before the Chamber of Commerce at Stratford, Ont., J. F. M. Stewart, of Toronto, a member of the board of directors of the Dominion Steel Co., and of the Canada Steamships Limited, had the following to say on business conditions.

He advocated the abolition of existing methods of Dominion taxation and the placing in effect of a system of taxes of one per cent. on all business transactions. He produced figures showing that the revenue from business sources of the Government would be about $160,000,000 under a system such as he suggests, or between $30,000,000 and $40,000,000 more than that derived under the present plan, and that the proposed plan would stimulate trade instead of stifling it.

Mr. Stewart was accompanied by his father-in-law, William H. Shaw, of Toronto, formerly of Stratford, who also spoke briefly to the meeting.

### Criticizes Tax System

Attacking the system of taxation used in raising money needed for war obligations, Mr. Stewart described the business profits tax and the income tax as unsound legislation, as in both cases it stifled business expansion and put a premium on the destructive system of simply investing money in bonds and letting it lie rather than developing and expanding business. In both cases it is an attempt to tax profits that may the following year turn into losses. He pointed out that the Government takes the profit on industry and the man takes the loss.

In place of the various present systems of taxation, Mr. Stewart suggested that a tax of one per cent. on the net turnover, or rather on all commercial transactions, should be collected by the last man handling goods before they reach the ultimate consumer. This plan, as before mentioned, would bring many more millions of dollars' revenue to the country, and would affect all equally, as the more a man spent the more taxes he would pay, and this would include the farmer as well.

## TECHNICAL MAN JOINS THE STAFF

**Major F. H. Moody, B.A.Sc., Member A.S.M.E., Links Efforts With Automatic Electric Truck Company.**

Powley and Townsley, Limited, with head office at 907 Excelsior Life Building, Toronto, have added to their staff Major F. H. Moody, who will act in the dual capacity of secretary-treasurer and chief engineer. This is another case where the technically trained man is coming into his own. This concern deal exclusively in a complete line of electric industrial and mine haulage equipment, battery charging and control apparatus, also Edison nickel-alkaline storage batteries.

MAJOR F. H. MOODY, B.A.Sc., Mem. A.S.M.E.

Major Moody has had a varied experience that will prove both practical and useful in his new duties, an experience that will be of real worth to their already numerous clientele. Major Moody commenced his engineering experience in 1903 as machinist's apprentice with the John Inglis Co., Limited, Toronto. This was followed by mechanical and electrical engineering course at University of Toronto, for which he received his degree of bachelor of applied science (with honors) in 1909. His vacation periods were spent in practical work with the General Electric Company, Schenectady, N.Y., American Locomotive Company, Schenectady, N.Y., and International Steam Pump Company, East Cambridge, Mass. Following a year as demonstrator in thermodynamics at the University of Toronto, he was successively associate editor Canadian Machinery, Power House and Canadian Foundryman, Toronto; associate editor Machinery, New York; Canadian Railway and Marine World, Toronto, until in July, 1915, he joined up with the 83rd Battalion for overseas service.

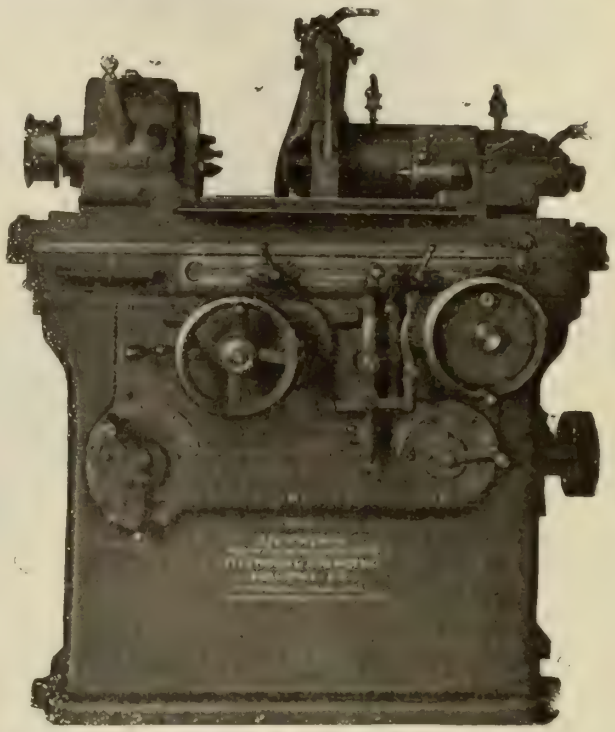
He served three years overseas with the 116th Battalion C.I.; with them he attained the rank of major. Returning to Canada with that unit in March, 1919, he became assistant chief engineer, McLaughlin Motor Car Company, Oshawa, relinquishing that position in January, this year, to assume the above new duties.

Major Moody intends to use his mechanical knowledge to the best advantage, viz., give advice that is based on experience. After all, this is the best kind of advice we can get, for all guesswork is eliminated.

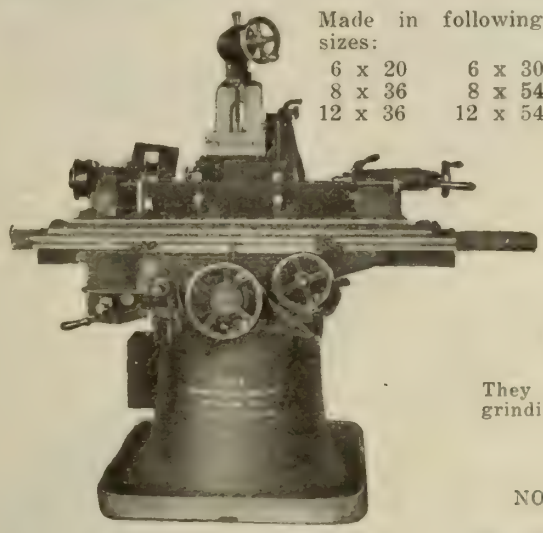
## BUSINESS IS GOOD NO DECLINE LOOKED FOR

**Factory Running to Full Capacity—New Equipment Necessary to Meet the Demand**

In a recent letter to the trade in general the Williams Tool Corporation, Brantford, Ont., brings out some interesting points, the general trend of which follows:



"The increasing demand for our pipe machines has kept our factory running to capacity and made necessary the installation of several large new machine tools. This in the face of the present readjustment.



"Pipe manufacturers have their busy seasons the same as other lines of merchandise. During the war pipe machines practically disappeared from the market, but now it is a different story. January showed the second largest in the history of the company. Pipe machines will not decline in price for some time to come for the reason that the retail prices of these machines were not advanced in the same proportion to the present price of labor and material. We are even protecting dealers against a decline in prices just as long as machines purchased for stock purposes remain unsold."

# GRINDERS

## FITCHBURG
### Plain Cylindrical Grinders

Carefully designed to meet the great variety of cylindrical grinding requirements. Occupies just half the floor space of the larger cumbersome machines. Rigid and powerful. Constructed on the unit system, each unit being entirely independent of any other and can quickly be removed from the machine. Equipped with automatic feeds and arranged for motor drive on request.

Made in following sizes:

| | |
|---|---|
| 6 x 20 | 6 x 30 |
| 8 x 36 | 8 x 54 |
| 12 x 36 | 12 x 54 |

## BATH Universal Grinders

They will do your cylindrical, internal, surface, disc, tool and cutter grinding with speed and efficiency. Made in 3 sizes:

No. 1, 10″ Swing, 20″ between centres, Wheel 10x¾″
No. 2, 10″ Swing, 25″ between centres, Wheel 12x1½″
No. 2½, 10″ Swing, 36″ between centres, Wheel 12x1½″

NOTE—Bath No. 2 machine will grind surfaces 20 x 9, 7½″ high.

### Tool and Cutter Grinders

Designed with the idea of combining strength and general utility with accuracy and easy operation, the Globe Universal Tool and Cutter Grinder is a machine which every Canadian manufacturer should include in his tool room equipment.

Centers swing work up to 8″ diameter and 15″ long.

### Other Grinders

Disc Grinders, Floor Grinders, Bench Grinders, Water Tool Grinders, Swing Grinders, Portable Pneumatic and Electric Grinders, etc., to meet requirements of any shop.

## Trade Gossip

There has been sharp price-cutting among English and Scotch iron and steel makers, particularly in shipbuilding steel, in order to capture the overseas markets.

The Canadian rights for the "Greaves-Etchells" type of furnace, which has been widely adopted in the United States, England, Spain and France, are also included in the arrangement made.

The Zionist colonies in the Holy Land state that they intend modeling their power generating system after that of the style adopted in Ontario. Power will be drawn from the principal streams of Palestine, including the River Jordan.

Captain Joseph Hough, a navigator on Lake Erie for more than forty years, died at his home in Port Stanley March 7, aged 70 years. He was born in Port Stanley and had resided there all his life, sailing his vessel out of that port.

Mr. T. J. Dillon, who recently resigned his position of president and general manager of the Canadian Foundries and Forgings Co., Ltd., Montreal, will interest himself in the manufacturing of different lines of steel products in Welland, Ont., and the Niagara district.

The E. A. James Co., Ltd., the well-known consulting engineering firm, have changed their name to James, Proctor and Redfern, Limited. This change in name gives recognition to Messrs. Proctor and Redfern, who have been connected with the company for some years.

T. H. Watson & Company, Sheffield, England, announce that arrangements have been made with the General Combustion Company of Canada, Limited, New Birks Building, Montreal, to handle, build and sell their various electric smelting, melting and refining furnaces.

The General Combustion Company of Canada, Limited, are also taking over the designs of the Electric Furnace Construction Company, Philadelphia, on the various types of electrically heated core ovens, annealing and heat treatment furnaces, and will have the active co-operation of the American company on electric furnace problems generally.

Senator Frederic Nicholls, vice-president of the Dominion Steel Corporation of Montreal, recently resigned from his position on the board of directors of the corporation. Senator Nicholls states by way of explanation that increasing duties in Toronto makes it difficult for him to attend the meetings of the corporation at Montreal.

The death occurred of James Albert Cole, a well-known manufacturer of North Bay, on March 6. Mr. Cole for some years had conducted a successful planing business. For 25 years he was foreman of the J. R. Eaton Co., of Orillia, and for the past year superintendent of the A. J. Young Lumber Co., of North Bay.

The Toronto Scale Co. have leased some available factory space in the building occupied by the MacFarlane Engineering Works at Paris, Ont.

The MacFarlane Engineering Works, Paris, Ont., are planning to extend their industry very materially by the production of a number of lines that have not been manufactured in Canada heretofore.

## Engineering

A new eight-roomed school will be built at Niagara Falls, Ont.

A factory at an estimated cost of $25,000 is planned by Nelson Match Co., Nelson, B.C.

Plans are in preparation for the $120,000 addition to the Brantford General Hospital.

Silverwoods, Ltd., London, Ont., are contemplating the installation of an ice plant with 25 tons capacity daily.

The Kamloops Canneries, Ltd., Kamloops, B.C., contemplate the erection of a fruit cannery costing $5,000.

It is expected that work will begin shortly on the erection of the plant for the Wills-Lee Co., Sarnia, Ont.

A match block factory to be built at Nelson, B.C., is being planned by J. D. Martin, of Neepawa, Man.

Thomas Wollings & Co., Connaught Station, Ont., contemplate the construction of rolling mills at cost of $60,000.

Application has been made by H. Savard, 124 Laurier Street, for permission to build a garage on Laurier Street, Montreal.

The erection of a building on the north-east corner of Spadina Road and Bridgeman Avenue is being planned by Langley's Limited at an estimated cost of $20,000.

The general contract for the erection of factory to cost $40,000 for Cridland and Sons, 1450 Gerrard Street E., Toronto, has been awarded A. Jeffries, Scarboro, Ont.

Provincial Government supplementary estimates for this year include, at cost of $60,000 each, for erection of new Veterinary College and Dairy Building at the O.A.C., Guelph, Ont.

New tenders will be called by W. H. E. Schmalz, architect, 288 Frederick St., Kitchener, Ont., from March 15 to April 1, for the erection of service station at an estimated cost of $15,000 for Reinhart and Doerr, 192 King Street west.

Cowie and Moore, 50 Craig Street, Ottawa, have the general contract for the erection of garage costing $18,000 for Drs. Liggett and Graham, 227 Clemow Avenue, and will receive tenders for gas tanks, Bowser pumps, roofing, electrical, plumbing and heating.

## Marine News

It was stated by P. A. S. Franklin, president of the company, that the agreement between the International Merchant Marine Company and the British Board of Trade, requiring the company to operate its ships without injury to British commerce applies only to British flag vessels.

The rumor that J. W. Norcross, president of the Canada Steamships, Ltd., would resign his office with this company, because he had been appointed as Canadian representative on the British Foreign Commercial Commission, has been denied by W. E. Burke, a director of Steamships.

A new wireless invention has been discovered by which ships may be guided during dense fogs, was announced by William Marconi at the British Shipmasters' Dinner. It is based on the principle that electric waves may be directed in any definite direction like flashes from a lighthouse. These waves would take the place of leading lights in thick weather and prevent collision of vessels during fogs. His invention has not been in operation anywhere yet.

It has been announced by Norman B. Conger, United States weather forecaster, that the radiophone will supplant the telephone and the telegraph in the distribution of weather forecasts from the United States Weather Bureau. Mr. Conger stated that the "radiophone" was being considered as a distributive medium. Storm warnings can be flashed to vessel masters at sea and vessel masters will be able to call up the weather office over the radiophone and get the very latest forecasts which will mean safety in sailing and no delays in taking of unnecessary chances by vessels.

That ice conditions in the Cabot Strait are the worst in ten years is reported by shipmasters who have succeeded in getting through the packs within the last few days. Newfoundland is reported to be entirely surrounded by impenetrable floes stretching from the Arctic circle to the gulf and dotted with monster bergs. It is expected that the opening of navigation in Cape Breton ports will be much later than usual this spring.

## YORKSHIRE PRICES ARE BEING CUT

**Producers Make a Bold Attempt to Revive Interest in a Dull Industry.**

London.—The pig iron producers of the Cleveland district of Yorkshire, in order to make a bold bid for a revival of the industry, which is in a state of stagnation, have made a record cut in prices of all Cleveland pig iron amounting to 45 shillings a ton. East coast hematite has been reduced forty shillings and steel prices are expected to follow.

# MORROW
## High Speed Forged Drills

TIME is saved when you use Morrow High Speed Drills. The operator thins out the centre at the point and only has to regrind about half as often as with ordinary high speed drills.

Don't merely say "drills" when ordering. Say "MORROW." More holes with less regrinding!

**Also manufacturers of cap screws, set screws, semi-nuts. Sole distributors of P-H and Imperial Brand Files.**

# INFORMATION DESIRED REGARDING VARIOUS TYPES OF MACHINES

"We are interested in the establishment of a factory in Sydney for the manufacture of conduit for electric wiring." So writes one of our correspondents, and they continue their query in the following manner: "As you may be aware, a company in Melbourne is already engaged on this class of material, but we think there is room for a plant in Sydney. We require the fullest possible information on the following:

"First—Machine for manufacturing hot rolled steel strip into close joint conduit. Sizes at first would be ½ inch, ⅝ inch and ¾ inch, or ⅝ inch size only. State shipping weights and measurements, also complete specification of machine, including output.

"Second—Machine for manufacturing steel strip into welded conduit. Sizes at first would be ⅝ inch and ¾ inch, or ⅝ inch size only. State shipping weights and measurements. Also complete specification of machine, including output.

"Third—Rolling mill for rolling steel billets into strip of required gauge for ½ inch, ⅝ inch and ¾ inch close joint; also ⅝ inch and ¾ inch welded (this machine will probably be too expensive a proposition at first). State shipping weights and measurements. Also complete specification of machine, including output.

"Fourth—Screwing machine for screwing ⅝ inch and ¾ inch welded. Alternatively for screwing ⅝ inch and up to 2 inch. State shipping weights and measurements; also specification of machine, including output.

"Fifth—Sample and price of hot rolled steel strip for manufacturing ½ inch and ⅝ inch close joint. In coils suitable for cutting into 12 ft. 6 in. lengths. State gauge, width, and number of feet to the ton. State packing particulars.

"Sixth—Sample and price of steel strip for manufacturing ⅝ inch and ¾ inch welded screwed conduit. In coils suitable for cutting into 12 ft. 6 in. lengths. State gauge, width, and number of feet to the ton. State packing particulars.

"Seventh—Samples and price of close joint conduit, rough, ready for enamelling, in ½ inch and ⅝ inch in 12 ft. 6 in. lengths. State gauge, and number of feet to the ton. State packing particulars.

"Eighth—Samples and price of welded conduit, rough, ready for screwing and enamelling, in ⅝ inch up to 2 inch, in 12 ft. 6 in. lengths. State gauge and number of feet to the ton. State packing particulars.

"We are anxious to purchase the most up-to-date plant available for the above industry and should be glad of all possible details regarding price, etc., making sure to state the best deliveries possible."

This is an ideal opportunity for manufacturers to send us in all possible information on the above queries, when we will forward the same to our correspondent without delay.

# DO ANY OF THESE LINES INTEREST YOU ?

Information regarding the following lines can be obtained by communicating with this paper and mentioning key number:

2758. **Electrical goods, leather belting, rubber goods, etc.**—A Turin house is willing to buy the foregoing articles in Canada.

2763. **Machine tools, etc.**—A very important Genoese firm would be disposed to negotiate with Canadian houses for machine tools.

2764. **Machine tools.**—A firm of import and export agents would like to enter into relations with Canada in the foregoing.

2766. **Steel wire ropes.**—A firm in Naples desires to hear from Canadian companies interested in doing business with Italy.

2769. **Wire rope.**—A Tokyo firm specializing in the import of British goods inquires for crucible steel wire rope of the following specifications:

Crucible steel wire rope, No. 7 (quality), 6 strand.—Cir. 2, 2¼, 2½, 2¾, 3 inches, 2,000 to 3,000 feet in length.

Crucible steel flexible wire rope, No. 24 (quality), 6 strand.—Cir. 1½, 1¾, 2, 2¼, 2½, 2¾ inches, 720 feet in length.

Samples and specifications are requested immediately.

2762. **Representation in Australia.**—Business gentleman at present in Toronto and returning to Australia would like to get into touch with manufacturers of millboard, suitable for shanks, toe-puffs, etc., in shoe and slipper manufactures. Kraft brown, sulphite and grease-proof papers, for paper bag manufacturing. Close-jointed tubing for bedsteads. Suspender and armband metal fittings. View to representation in Victoria, New South Wales, Queensland and South Australia.

---

The discovery of a method of utilizing volcanic iron sand for the manufacture of steel, which, if adopted, would make Japan independent of steel imports, has been announced by the Japanese War Office. Experiments were started some time ago with iron sand, of which there are unlimited supplies in the country, and tolerably good results were obtained from practical experiments at the Penchihu blast-furnace. Although the discovery is successful from a military point of view, any economic advantage does not necessarily follow.

## WHO CAN SUPPLY HIGH TENSILE OVAL WIRE?

A correspondent writes as follows: We are desirous of forming connections with some well-equipped steel mill who are in a position to consider seriously the manufacture of galvanized high tensile oval wire, under the following specifications:

| Size. | Close Joint S. W. G. | Screwed S. W. G. |
|---|---|---|
| 1/2" | 19 | 16 |
| 5/8" | 19 | 16 |
| 3/4" | 18 | 15 |
| 1" | 18 | 15 |
| 1 1/4" | 17 | 15 |
| 1 1/2" | 16 | 14 |
| 2" | 16 | 13 |

| Paris Gauge | Resistance in Kilos. | No. of Bends. | Length of Coil in Meters. |
|---|---|---|---|
| 19 17 | 1000 | 4 | 625 |
| 18 16 | 850 | 5 | 830 |
| 17 15 | 700 | 6 | 1120 |
| 16 14 | 650 | 7 | 1410 |

Coils of 45 kilos each, coils of one piece of wire, electrically welded where necessary, and coils are usually wrapped in heavy, tarred, weatherproof paper.

We have virtually controlled the sale of oval wire in South American markets for the past two years, and during that period we have secured orders amounting to approximately five thousand tons. The South American buyers have not been entirely satisfied with the oval wire which has been furnished them, and as we are desirous of holding the trade, which we have established, we are looking for a mill who could co-operate with us as per above specifications.

If you will kindly put us in touch with a mill who would be disposed to enter into the manufacture of this material, we would then submit our proposition in detail and could probably offer the same volume of business. How about this? Who can give us this information?

### IMPORTANT TESTS

Tests carried out by the United States Bureau of Standards on the value of slags for fine and coarse aggregate indicate that the concrete so made seems to be of an equal strength with concrete made from ordinary gravel. The conclusions of the Bureau are as follows: Crushed slag as a coarse aggregate produced concrete of as high a strength as gravel. The tests were not extensive enough to determine the durability of the slag, but to the extent of the tests there were no signs of disintegration due to the sulphide sulphur or other causes. Slag sand, because of its lack of fine material, does not produce easily workable concrete when used as a fine aggregate. If it must be used its working qualities can probably be improved by the addition of small amounts of fine sea sand, hydrated lime, or other fine material. Provisions in specifications for slag aggregate calling for a maximum sulphide content of 1.5 per cent., and a minimum weight per cubic foot of 70 pounds, are tentatively recommended.

DOMINION CHUCKS

STEEL OR CAST-IRON BODY
BUILT FOR HEAVY DUTY

All Screws Are Reversible

SCREWS are made of the best grade steel. Both ends are broached and are heat treated after machining. They are reversible, so that either end may be used, are large enough in diameter to stand the torsional strains applied by operator when setting up his work. They are made to give the best service—and may be depended upon to stand up under the hardest usage.

### OAKOAL CO. IN LIQUIDATION

The Oakoal Co. has gone into voluntary liquidation. A statement issued by the company says that although not in a state of bankruptcy, the present financial depression made it difficult to collect on stock subscribed, which approximates the amount the company owes. E. R. C. Clarkson & Sons have been appointed receivers.

The statement adds that "the company has for the past three months been making anthracite briquettes and will continue to do so. The idea of going into voluntary liquidation is simply to give ample time for reorganization, collection of outstanding subscriptions and meeting all obligations."

## CATALOGUES

The Cincinnati Electrical Tool Co., Cincinnati, O., have recently issued a new catalogue No. 14, covering their complete line of Portable Electrical Drills, Grinders and Buffers. This catalogue contains several new type machines which the company recently brought out, and should prove of interest to anyone using or intending using such equipment.

### NEW CATALOGUE

The Williams Tool Corporation, Brantford, Ont., and Erie, Pa., have issued a loose-leaf catalogue dealing with their complete line of pipe threading and cutting machines. It is also descriptive of the Williams patent receding die head designed to cut straight or taper threads of any degree to any length. The Corporation is also issuing a monthly delivery sheet, listing machines and motors that are immediately available.

### PRESS BOOKLET

The Baird Machine Co., Bridgeport, Conn., have issued a booklet dealing with their double action tandem press. Examples of work performed are shown and it is stated that the press, when equipped with simple tools, will automatically feed the metal to the front press, pierce, stamp, letter or do any such follow-up work, blank, hold down the blank and draw, then transfer to the back press and redraw, pierce, stamp or perform any operation that might be carried out in a single action press. Tumbling barrels are depicted in the latter part of this booklet.

### CLUTCH CATALOGUE

The Hanson Clutch & Machinery Co., Tiffin, Ohio, have issued a catalogue No. C 3 which deals with their line of friction clutches. Different styles and sizes are shown, also typical installations. The book is in itself a regular text book on the subject of this type of clutch.

### DRILL PRESS BOOKLET

The Aurora Tool Works, Aurora, Ind., have issued an attractive booklet on their line of upright drills. The different styles as manufactured are shown with complete specifications, and the various features are explained in detail. The booklet is of loose-leaf construction and can be added to as the line grows.

### NEW FOLDER

The Canada Machinery Corporation, Galt, Ontario, have issued a rather interesting folder entitled "Cut Your Costs." The interior of the circular shows various machine tools manufactured by this concern, and tells of various features embodied in the same. An invitation is also issued to visit their works and see the facilities they have for machine tool building.

### Coolant Pumps Are Superior

first, because the working principle is correct. They are Rotary Geared and this type has not been surpassed since it was first designed, in the sixteenth century.

They will pump water, oil, or compound in heavy streams without pulsation. No loss of prime. Reverse with machine, work against 100 lbs. pressure, supply up to 16½ G.P.M. Run at low speeds, giving long life.

We shall gladly send our illustrated booklet giving details.

## Are You Looking for a Steam Pump that's Better Than the Ordinary? Then take Note of this

# HEPBURN

In the Hepburn Steam Pump the steam chest is located on the side of the cylinder and the low ports automatically drain away all condensation. This prevents water hammer in the cylinder and ensures a perfect **cushion for the steam piston.**

The Hepburn is the **only** self-draining Pump made in Canada. There are no levers or appets to get out of order. You **will find our prices right.**

We also make: Vertical Engines, Compressors, Winches, Cut Gears, Derricks, Road Machinery, Hydrants, Blacksmith Work and Grey Iron Castings.

JOHN T. HEPBURN, LIMITED *ENGINEERS AND IRON FOUNDERS*
18-60 VAN HORNE STREET, TORONTO, CAN.

# George Ham says "Good-Bye"

A STRIKING and affectionate farewell is bade by Col. George H. Ham in the March 15th issue of MACLEAN'S MAGAZINE, to his thousands of friends, as well as to other readers who may know him only by hearsay, who have been following his reminiscences in Canada's National Magazine since last August.

"The Curtain is Rolled Down, for seventy-three years makes a long act," says George. "Recalling three score and ten of these years has been a pleasant though difficult task; thirty-three of them have been spent in the service of the C.P.R., and one cannot but realize that the corridors of the Company's office will not long be trodden by the older ones of this generation and that some of us perhaps will soon not even be a memory."

# "There Were Giants in Those Days"

The concluding instalment of this remarkable, all-Canadian feature, is the biggest and best of the lot—and here is the proof: There are seven full magazine pages, chock full of stories of those amazing days when the C.P.R. was conceived and constructed; human, hitherto unpublished details of the lives and careers of those three veteran founders, and, later, presidents of our first transcontinental: **Lord Mount Stephen,** the late **Sir William Van Horne,** and **Baron Shaughnessy, K.C.V.O.** And funny stories! Well, just read about Baron Shaughnessy's racing experiences; the pranks George Ham and William Stitt used to play on each other; Fred Cook's "German Band," and countless other incidents that could only be retained in such a mind—and heart—as that possessed by Canada's grand old raconteur.

# Big Features of Fiction and Fact

**"Personality, Plus"**—By Guy Morton.

A fascinating story about an advertising agency man who put across a trick to close a contract—and then gave the whole game away.

**"Lenix Fools the Jinx"**—By Archie P. McKishnie.

Another of those deliciously droll Lenix Ballister negro stories, in which more than the usual number of comic and absurd scenes are depicted.

**"Pawned"**—By Frank L. Packard.

The third instalment of this masterful serial goes a long way to show how the triple regeneration is going to be effected.

**"Broadway to Brussels"**—By C. C. Jenkins.

The story of the rise of J. H. Gundy, a shy youngster, who developed into one of Canada's most brilliant orators and a leading financier.

**"Little Bundles of Pluck"**—By Agnes C. Laut.

In this, Miss Laut tells with graphic pen the story of some of the war brides who are making good out on the lonely prairies, where they and their husbands have been located by the S.S.B.

**"A Woman Would Know ——"**—By Charles G. Booth.

This whole gripping story centres around the possession of a wee bundle of humanity, cursed with a dope-fiend father. There is plenty of love interest, too.

**"Those Who Stood in Darkness"**—By J. L. Rutledge.

A symposium giving the opinions of a number of Ministers of various denominations on some of the doubts which have arisen in this war aftermath, in the minds of many Christians—and others. An Easter Message.

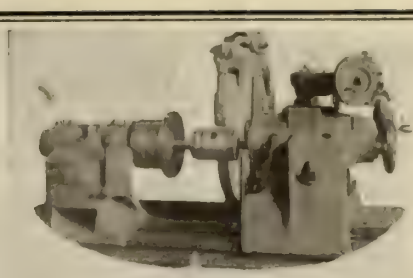
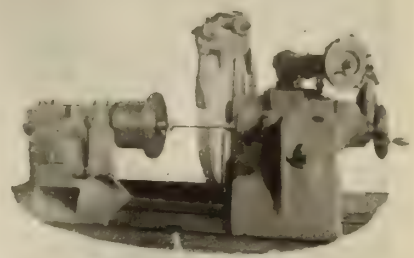
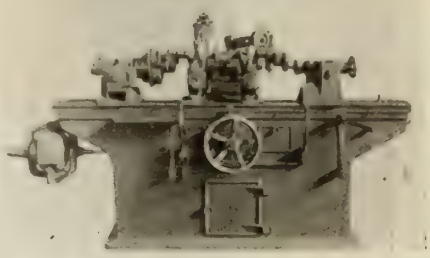
LANDIS







# No. 4A SPECIAL GRINDING MACHINE

This Landis Grinding Machine can perform all the grinding operations necessary to repair any gasoline motor as good as new.
It is designed especially for the small shop not having a large volume of similar parts. On such work it **will** show profits. We know it can be done even if you have only a small amount of repair work. Write us to-day.

A HENDEY LATHE

*In the Plant of the Dubois Watch Case Company of Brooklyn N.Y.*

# Accuracy First!

A reputation for dependable accuracy backed up by demonstrated performance, placed the first Hendey Lathe in the plant of the Dubois Watch Case Co. Since that time, the consistent precision which they have been securing has caused this firm to specify "Hendey" on all orders for new machines.

The Hendey above is used for turning, facing and boring tool steel in the making of thread cutters.

Bear in mind the precision of Hendey machines when considering the purchase of lathes, shapers or millers.

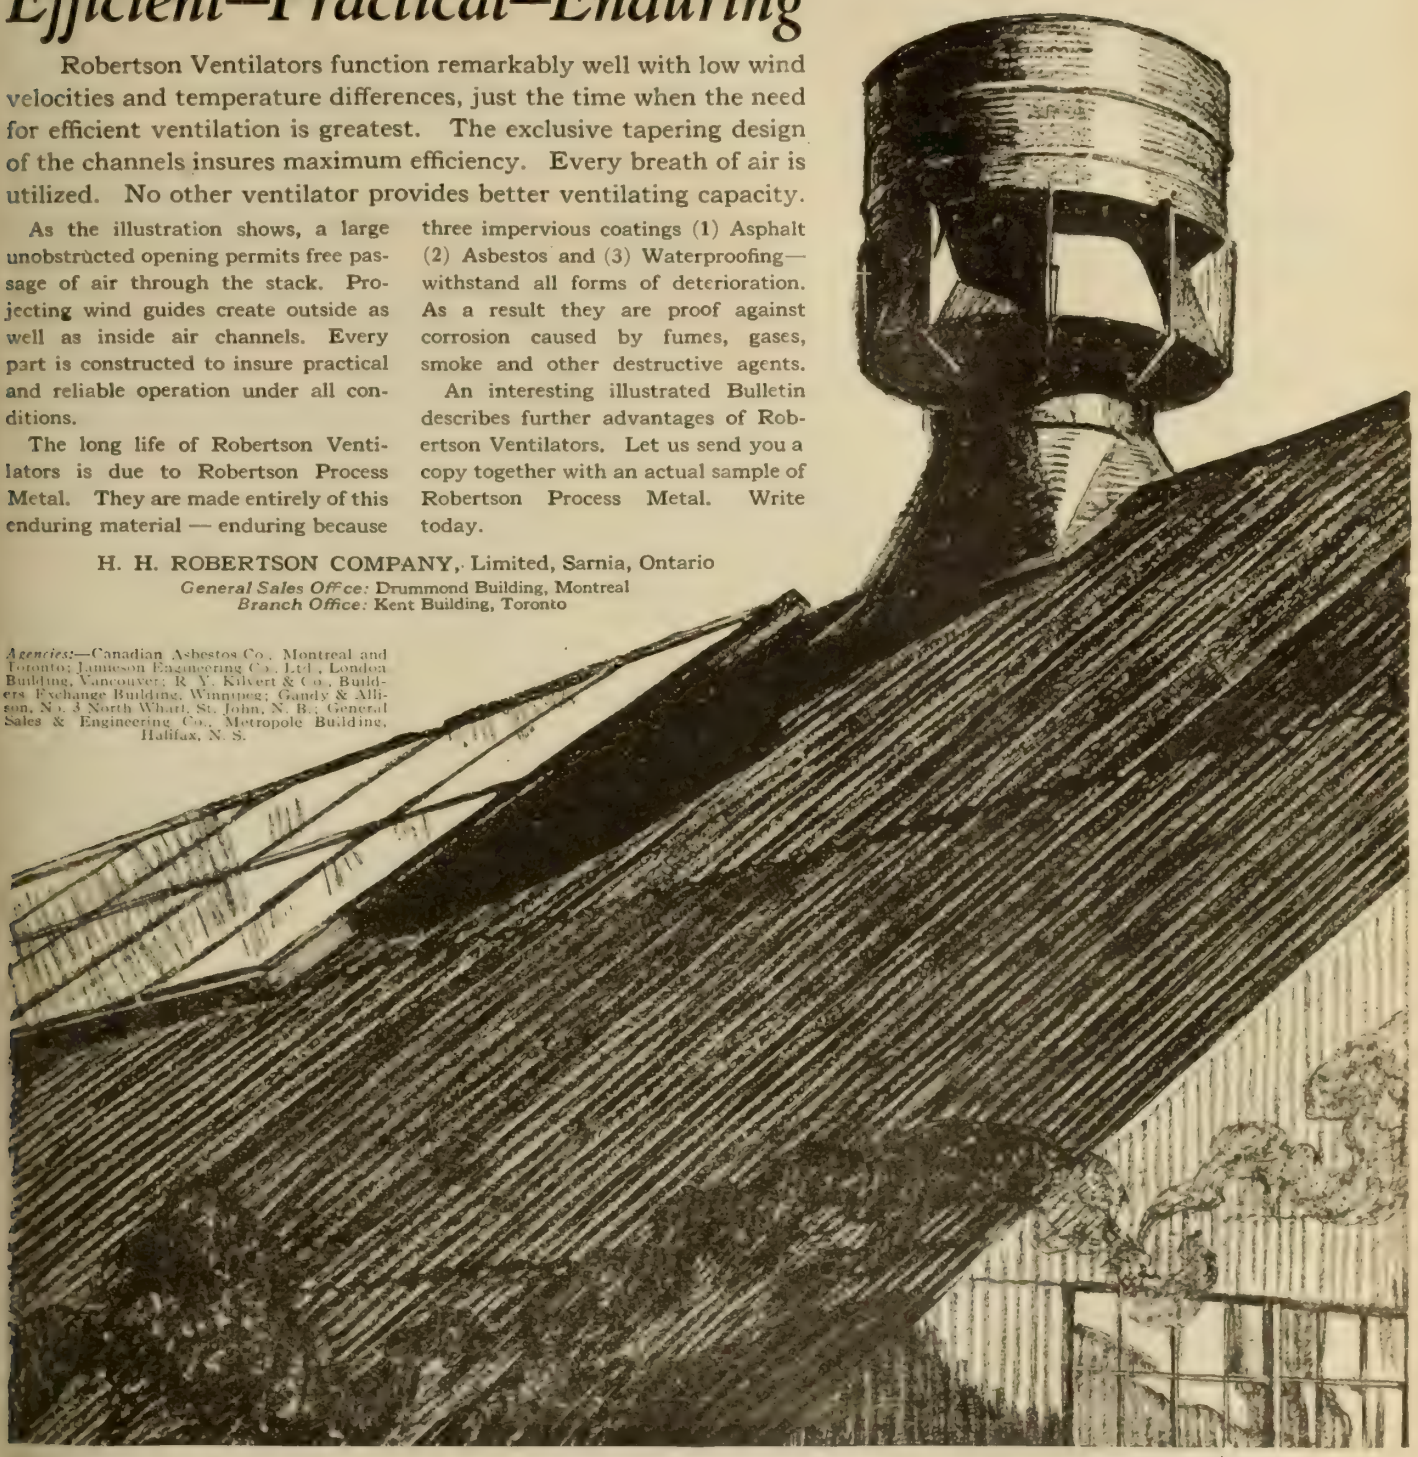
# Robertson Process Ventilators

## *Efficient—Practical—Enduring*

Robertson Ventilators function remarkably well with low wind velocities and temperature differences, just the time when the need for efficient ventilation is greatest. The exclusive tapering design of the channels insures maximum efficiency. Every breath of air is utilized. No other ventilator provides better ventilating capacity.



As the illustration shows, a large unobstructed opening permits free passage of air through the stack. Projecting wind guides create outside as well as inside air channels. Every part is constructed to insure practical and reliable operation under all conditions.

The long life of Robertson Ventilators is due to Robertson Process Metal. They are made entirely of this enduring material — enduring because three impervious coatings (1) Asphalt (2) Asbestos and (3) Waterproofing—withstand all forms of deterioration. As a result they are proof against corrosion caused by fumes, gases, smoke and other destructive agents.

An interesting illustrated Bulletin describes further advantages of Robertson Ventilators. Let us send you a copy together with an actual sample of Robertson Process Metal. Write today.

## METAL FOR ROOFING AND SIDING

C.M.C.

30" x 30" x 6'

# IRON PLANER

## An Accurate and Economical Producer

The belt shifters are arranged to guide one belt entirely off the driving pulley before starting the other on. Aluminum alloy driving pulleys are used, and due to their lower specific gravity, they do not develop the momentum of cast iron pulleys, and this has eliminated all over-run of the table. On this account, somewhat slacker belts may be used, prolonging the life of the belts and driving mechanism.

Built with one or more heads, different styles of belt drive or motor drive to suit customer's requirements.

# IMCO IMCO TOOLS

## Accuracy

Much of the work done in the average shop requires finishing within exceedingly close limits of accuracy.

The precision possible at fast speeds and feeds with "Imco" Drills, Reamers, and Milling Cutters, is daily proving their value to more and more shops.

Whenever you require tools for accurate work—think of "Imco."

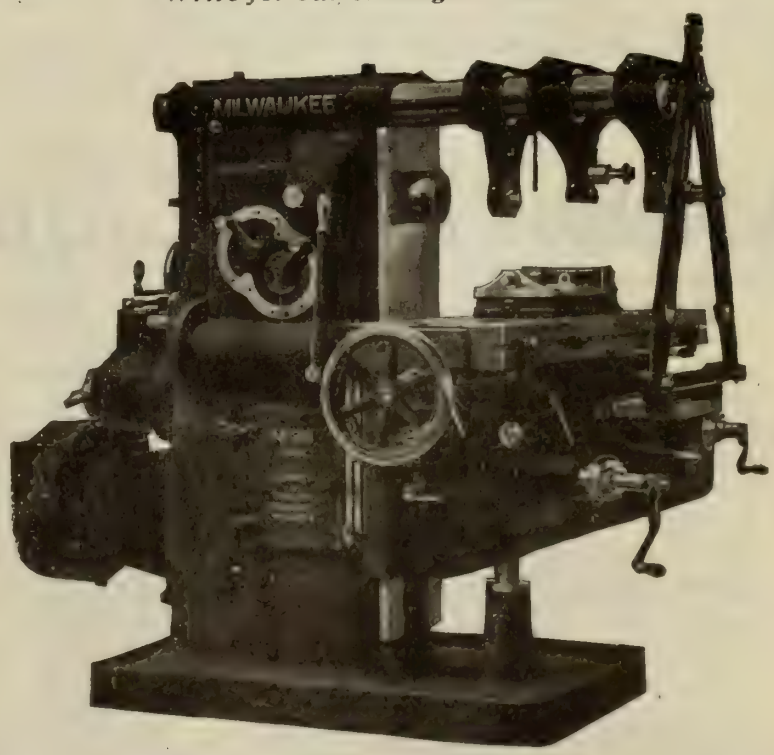
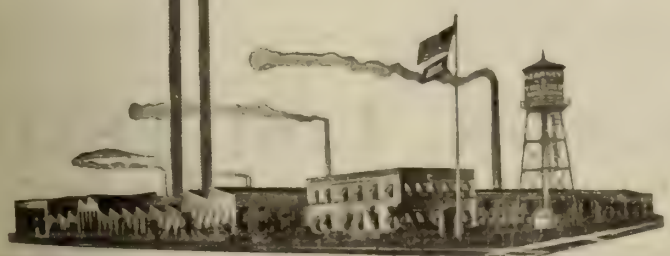
# MILWAUKEE MILLING MACHINES



## EFFICIENT MILLING



The rigidity and reserve power of Milwaukee Milling Machines permit high speeds and deep cuts without impairing the accuracy of the work.

These sturdy machines are quickly set up and easily operated. They are economical on light or heavy milling.

Constant speed drive, hardened steel gears and shafts, automatic flooded lubrication, double overarm, solid top, box-section knee with extended slide, flanged spindle, reverse self-contained, cutter lubricating pump that operates only when spindle revolves—these are the features that make Milwaukee Milling Machines profitable producers.

# CLEAN WITH AIR

By simply pressing the button the CIRCO BLOW GUN will give you a powerful cleaning jet whenever and wherever you want it, and the flow of air stops the instant the operator's thumb is removed from the button, thus eliminating the time wasted in opening and closing a globe valve or kinking the air hose while the valve is being opened or closed.

The CIRCO BLOW GUN is a sturdy little tool made from a bronze casting and has a metal to metal seat for the valve. It contains no gaskets or delicate parts to get out of order so that it will last a long time and will not leak.

Write for Prices.

# *Examine the Grain!*

A properly alloyed babbitt has a perfectly uniform grain.

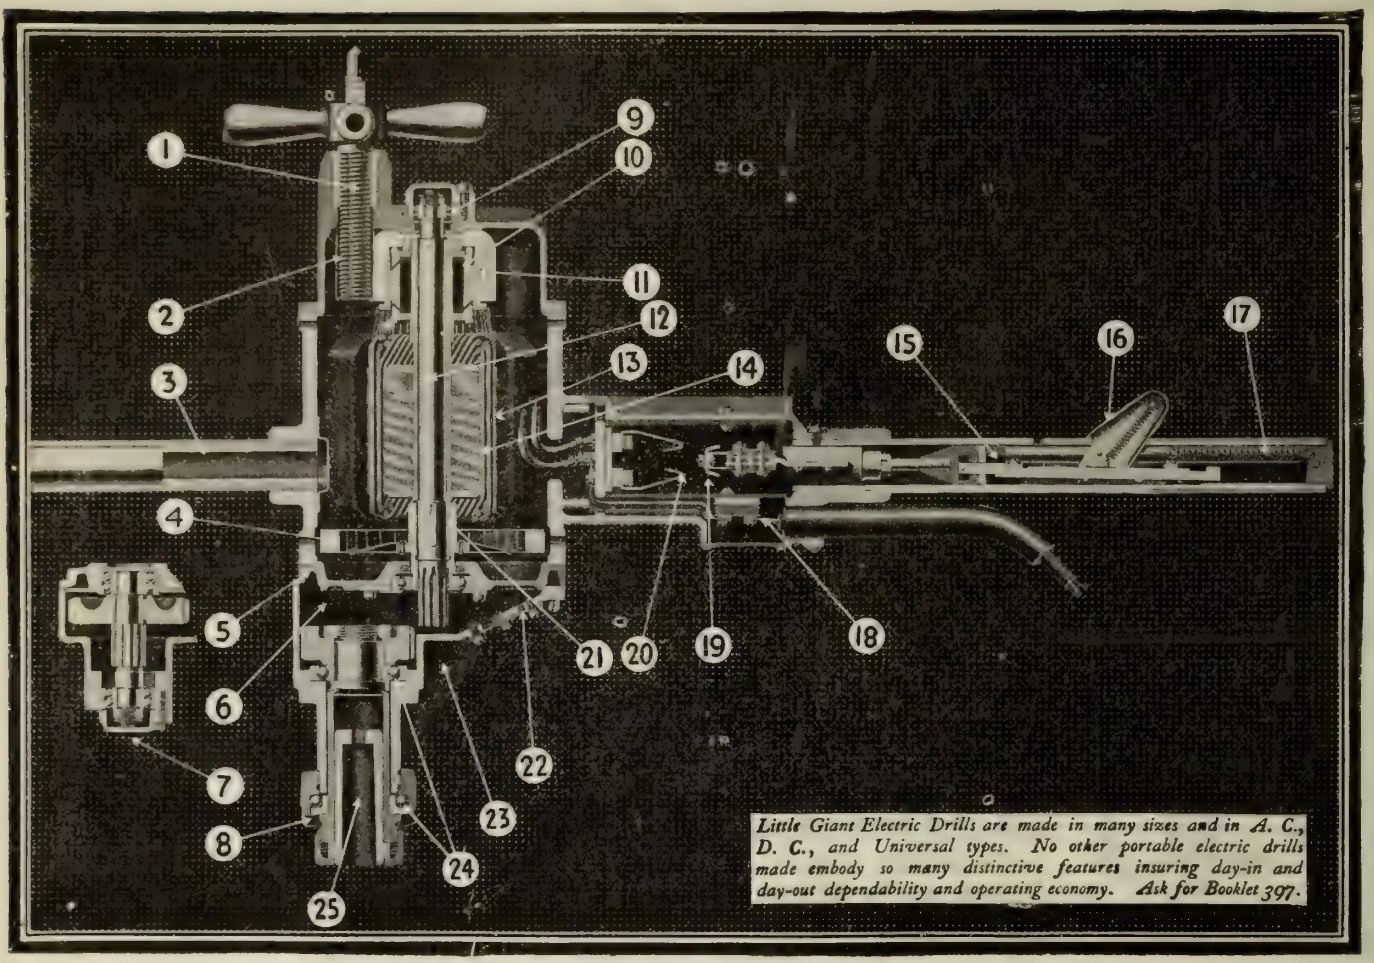
Break a bar of the babbitt you are using—

If you find the grain irregular—if it shows a mixture of fine and coarse particles—if it shows a separation of layers—one dark and one light in color—

then you may know that it is poorly alloyed—and that you can get far better wear from

# *Lionroyal*

produced by the STANLEY PROCESS of alloying.



Lionroyal is clean—uniform—dense grained—and durable.

It is copper-hardened and tin-toughened. Bearings lined with it carry the load evenly—every inch of bearing surface equally durable.

It has no hard spots of copper or antimony, because the hard elements are thoroughly and uniformly amalgamated with the tough elements. This fact bespeaks steady service and long wear.

***Write for Booklet "AB" to know more about pouring and using Babbitt.***

**BRITISH SMELTING & REFINING COMPANY LIMITED**
**MONTREAL**

*Little Giant Electric Drills are made in many sizes and in A. C., D. C., and Universal types. No other portable electric drills made embody so many distinctive features insuring day-in and day-out dependability and operating economy. Ask for Booklet 397.*

# Inside Information

## *why Little Giant Electric Drills accomplish results*

1 Long feed screw entering into body of supporting bracket, thus giving same results as telescopic feed.
2 Protecting sheath, preventing entrance of dirt into drill if feed screw is removed.
3 Dead handle reinforced at point of greatest strain.
4 Sheet steel fan, carefully balanced and reinforced, providing thorough ventilation.
5 Solid transfer plate or diaphragm preventing grease or oil in gear case from entering windings.
6 Liberal grease compartment for providing reliable lubrication of gears and ball bearings.
7 Section thru intermediate gears. Note wide *double* row of ball bearings at each end of gear shaft (used on large drills). Pinion and gears made of special alloy steel carefully heat treated.
8 Dust protector for excluding dust from lower thrust ball bearing.
9 Ball bearing easily accessible for lubrication and inspection.
10 Commutator of sturdy design and construction, thoroughly insulated with mica.
11 Large opening with well secured and readily removable cover plates providing easy access to brushes and commutator.
12 One-piece armature shaft and pinion of tool steel, hardened and ground, insuring perfect alignment of pinion at all times. On large size drills armature shaft is removable from the armature core and commutator, which are mounted jointly on a quill or spider.
13 Laminated pole pieces, minimizing pole face losses (used on large drills).
14 Armature coils form wound, heavily insulated, and carried in insulated slots in armature core. After winding and connecting to commutator, coils and armature are again dipped in insulating varnish and baked.
15 Quick acting control switch, making slow break impossible and preventing destructive burning of contacts.
16 Conveniently located trigger for operating switch.
17 Safety return spring for automatically opening switch when operator removes hand from switch handle (used on large drills).
18 Terminal block for cable, permitting ready removal of cable without disturbing other connections.
19 Cover plates on each side of switch, providing easy access to switch contacts.
20 Double pole, double break switch. Rugged contacts are readily removable.
21 Long fan-hub of high grade steel, hardened and ground. Press fit on shaft with long key insures permanent rigidity.
22 Cover plate quickly removable for inserting grease in gear case.
23 Reinforcing rib on gear case, insuring proper strength and rigidity.
24 Combined annular and thrust bearing at each end of spindle.
25 Removable socket inserted in spindle. Driving lugs on socket milled from the solid.

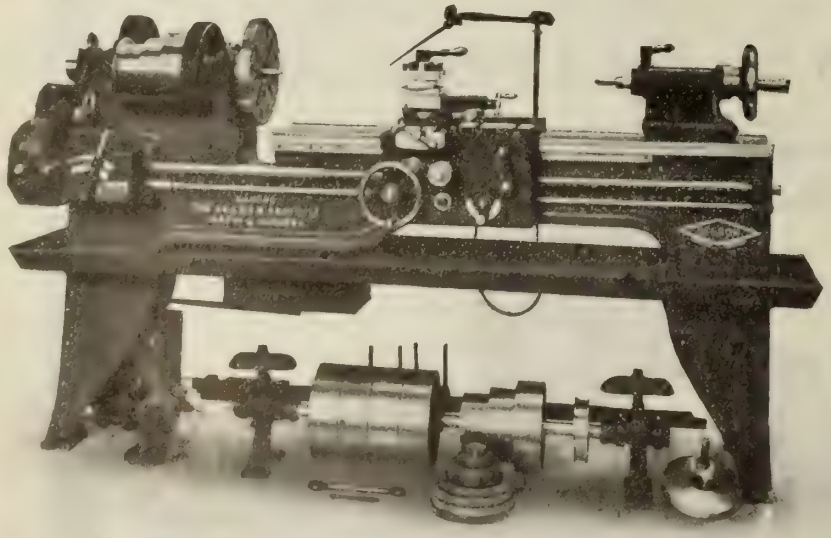
# tools for Your Plant

Thor

## PORTABLE ELECTRIC DRILLS

Drills unequalled for power at their weight; motors, hand wound, triply insulated, all encased in light aluminum. The result is drilling power when needed, right from the nearest electric light socket. Many plants using air tools have a number of sturdy electrics to handle the special jobs away from the air line. Others have standardized in speeding up production with THOR electrics.

THOR Electric Tools include 8 sizes of Portable Drills, with drilling capacity in steel, ranging from ¼″ to 2″; and a Portable Grinder with 4″ wheel. Get three or four THORS for demonstration on your work. Until you are convinced of THOR quality, you are not obligated.



The THOR line also includes a complete list of Portable Pneumatic Tools.

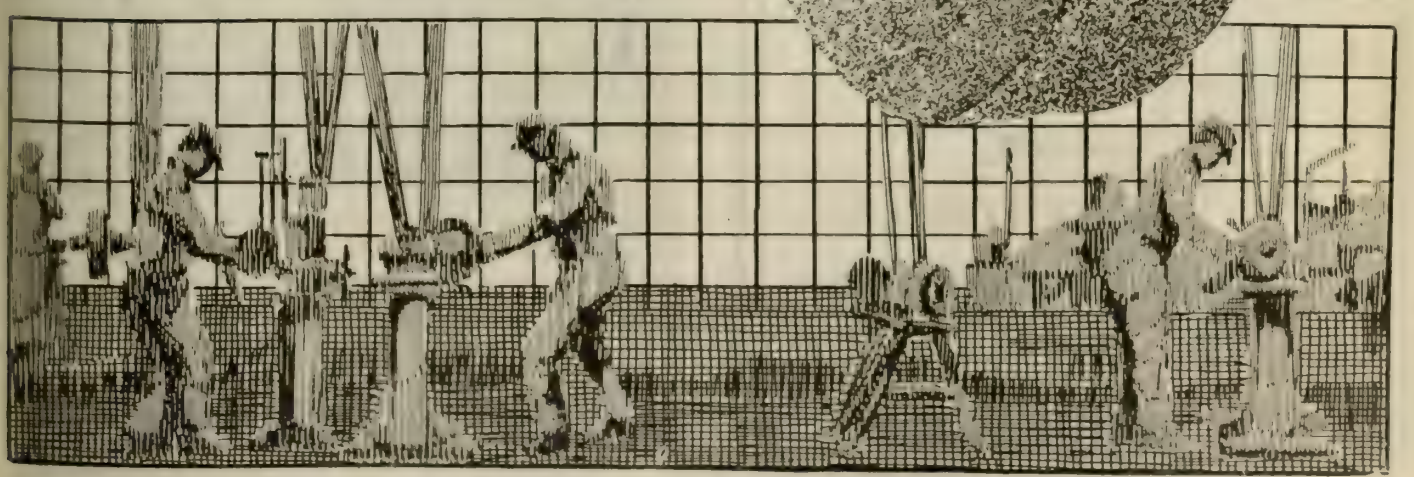
# CANADIAN HART GRINDING WHEELS

THE factory tests that all Canadian Hart Wheels are subjected to gives you an absolute guarantee that they are free from defects. Each wheel is also carefully inspected for size, grain and grade, so as to make certain that every wheel is in accordance with specifications on your order.



Canadian Hart Wheels are not inclined to "gum up" or "glaze," because they are made of proper abrasive grains of a suitable degree of hardness; especially is this true when the buyer secures the co-operation and advice of our engineering staff with a view of getting the right wheel for the job.

**How can we serve you?**

## New Air-Tight Blast Gates

will help you maintain the safety, economy and efficiency so essential in the operation of furnaces and other appliances using low or moderate pressure air.

THEY ARE SAFE— because they are ruggedly built of only a few simple parts; the blade stays fixed in any position and by a slight pull of the handle is easily adjusted to give the blast desired.

THEY ARE ECONOMICAL—because the initial cost is small; the simple construction eliminates wear and tear.

THEY ARE EFFICIENT—because careful machining makes them AIR-TIGHT; they afford the full area of the blast pipe, in striking contrast to a stop cock; they are quick in operation; they can be placed in any position.

*In short, these New Air-Tight Blast Gates possess all the advantages of stop cocks and valves, and have special features that tend for greater usefulness and economy.*

SHEPARD

ELECTRIC CRANES & HOISTS

## This "Shepard" reaches every point outdoors and indoors

A Shepard Crane travels the length of the yard, and a Shepard Cage-Controlled Hoist operating on the I-Beam track of the crane covers the width. In this manner a load can be picked or lowered at any point in the yard.

The crane can be run opposite and connected with the overhead Monorail trackage that extends throughout the plant. Here the hoist and load can be run on to the track that makes accessible the various departments indoors.

This equipment is a big aid to production and expedites the necessary rehandling between departments.

Shepard Traveling Cranes are made in capacities of 1 to 50 tons, Electric Hoists and Monorail Cranes ½ to 30 tons.

***The advice Shepard engineers are able to offer will prove helpful if you are contemplating a faster and more economical method of rehandling.***

## The "Lehmann" Improved Selective Head Lathes
(Patents Pending)

SIZES—14" to 24" SWING

On account of its simplicity of construction, great driving power and rigidity, ample range of speeds, moderate tooth travel of its gears, compact and shapely appearance, the "LEHMANN" Selective Head Engine Lathe stands to-day in a class *ahead* and *alone*. Some of the features of construction are:

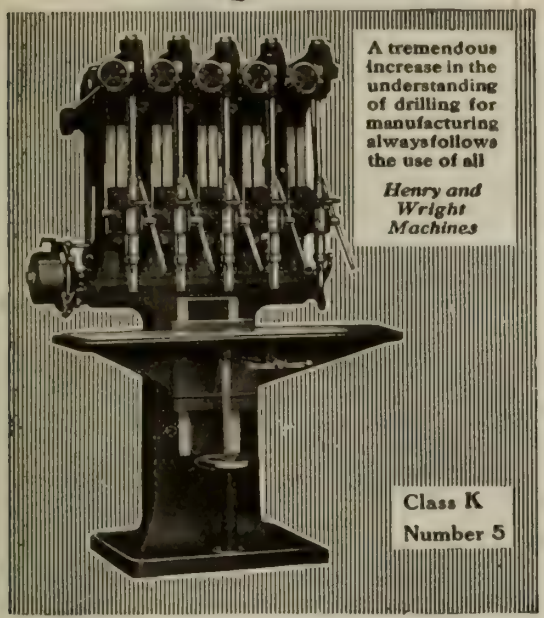
Sixteen Spindle Speeds in correct geometrical progression obtained with the use of only ten gears.

Improved Friction Clutches (Patents Pending) running in oil, requiring no adjustment and giving forward and reverse control to spindle.

Heat-treated or Hardened Steel gears.

All Shafts, except spindle, running on ball bearings.

Spindle of alloy steel, hardened and ground at the bearings and running in phosphor bronze boxes.



Head Casting forms oil-tight case enclosing all running parts.

In addition these lathes embody all features such as the patent quick change mechanism, the tailstock spindle locking device, the rod and screw shift, etc., forming part of the "LEHMANN" Cone Head Lathes which have acquired an enviable reputation for accuracy and production.

*Let us describe more fully this Exceptional Lathe and its Distinctive Advantages*

# HEALD Power Feed Internal For Small Work

**Capacity**

Holes $\frac{1}{4}$ to 2" dia X $3\frac{3}{4}$ long
Swing inside gaurd 8"
Swing without guard 10"

A rugged machine for precision grinding of small work. It is modeled on the lines of the very successful Style No. 85 having all its mechanical features and in addition is equipped with power feed for table. This is very desirable for work with close limits, small diameter and the length of which makes it preferable to have the power feed for the table travel.

A unique feature of this machine is the vertical pinion for driving the table which is equipped with a double friction of simple but durable construction. By simply throwing a lever, either of these frictions may be engaged at the will of the operator. In one position the machine may be used with the automatic features, in the other it becomes hand feed.

*We would like to send you a bulletin on this machine or catalogue of our entire line*

# Tool Room Work

## Tool Room Grinding

The selection of grinding wheels for tool room use is a matter of great importance to the shop man. There is a correct wheel for every operation and condition, but in many cases this can only be determined by actual test.

The wheel commonly sold for inserted tooth milling cutters is a 3846-K Alundum—but some conditions call for a J or even an L.

Other types of solid milling cutters require 3846-J or K Alundum vitrified, although 3860-I Alundum vitrified or silicate is a popular wheel in the saucer shapes.

For sharpening twist drills we recommend a 46-grain Alundum, either vitrified or silicate, grades K to M.

For lathe and planer tools of high speed steel, the wheels depend upon the type of machine used. The range of grades includes M, N, O and P, and the grain will run from 20 to 80, depending again on whether the operation is automatic or off-hand grinding.

VOL. XXV. No. 11 March 17, 1921

# *Application of Ball Bearings to Machine Tools*

Motors — Fans — Countershafts—Worm Drives—Saws — Grinders — Shapers and Lathes. Method of Applying Ball Bearings to These Machine Tools

*By Gordon Janes*

IN the Feb. 24th issue of Canadian Machinery there appeared an article dealing briefly with the history of ball bearings, from that point leading up to the actual installation of the same. In the present article we shall go into the mounting and installation of such bearings, illustrating wherever possible the sectional view of the equipment.

### Annular Bearings

In mounting annular bearings, care must be taken that the inner race is a permanently tight fit on the shaft; otherwise the continued action of the load, concentrated on the short shaft length corresponding to the bearing width, will, in time, peen down the shaft. It is unwise to place reliance on a drive fit alone, as they may be destroyed by an occasional dismounting, or by the action referred to above. Binding the inner race endwise between a substantial shoulder and well set up nut creates a frictional grip on the shoulder and nut faces that prevents the transfer to the shaft surface of the destructive influences cited. This binding action forms an excellent substitute for bearing seat length. Neglect in this direction results more generally in damage to the shaft, but occasionally to the bearing as well.

The outer race should be a sucking fit in the housing. If this race be fixed against rotation, the load always comes in the same place; but if allowed to take up a different position from time to time, new sections of the race are constantly coming under the influence of the load. A sucking fit of the race will be accompanied by a slow intermittent creep under the slight vibrations of the load. In order not to prevent this beneficial creep, the sides of the outer race should never be absolutely clamped, even when the race is held between shoulders to prevent end movements of a shaft. A slight clearance of 1/100 of an inch, or as much as is admissible, should be left on each side.

If the outer race is a tight or driving fit in the housing, it is impossible, in assembly, to be sure the bearing is not assembled out of line, due to the narrow width of the bearing compared with the diameter. In fact, it is nearly a certainty the outer race will be cramped or out of line when assembled under such conditions, with the consequently rapid destruction of bearing races and balls. Such bearings will appear as if subjected to a heavy end thrust and overloaded. Fig. 15 (shown in February 21st issue) illustrates the correct method of mounting a shaft on ball bearings, bearing B restraining the shaft against end wise motion, and bearing A being free to move axially in the housing.

### Thrust Bearings

When mounting self-aligning thrust bearings on vertical shafts, it is advisable to give the aligning washer some freedom of sidewise movement to permit it to assume its best position in case of shaft oscillation. With such a freedom allowed, the shaft should be a snug fit

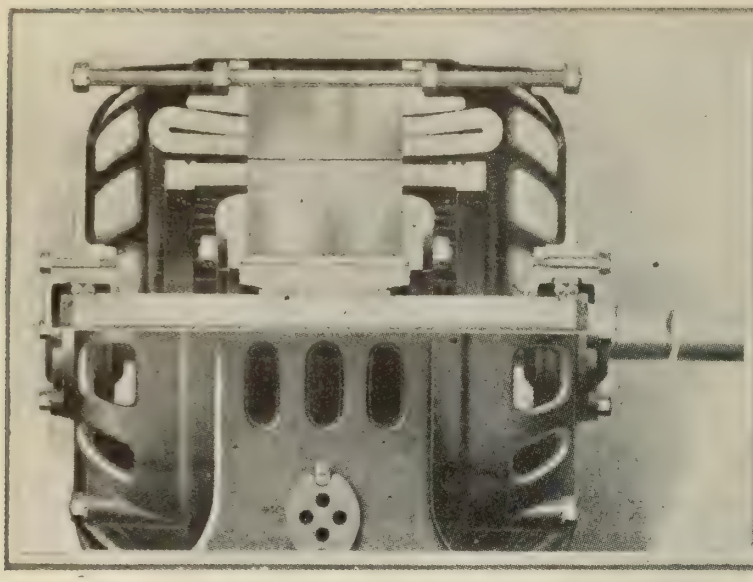

FIG. 16—MOTOR EQUIPPED WITH BALL BEARINGS.

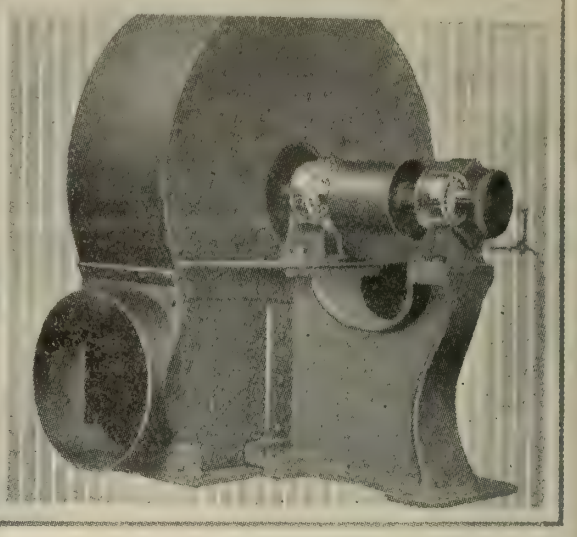

FIG .17—A GOOD EXAMPLE OF A FAN SPINDLE EQUIPPED WITH BALL BEARINGS.

in the upper or smaller collar B. See Fig. 11 in previous part of article.

For horizontal shafts, the collar B should be snug fit on the shaft, and the aligning washer should not have more than 0.01 inch clearance each side, so as to prevent the ball cage, spherically seated race and aligning washer from dropping when the load is released, thereby bringing up possibility of destructive pinching of balls when load is again applied.

Wherever shaft deflections are liable to occur, it is particularly necessary that a self-aligning type of bearing be used, and that the bearing be mounted as outlined above.

### Typical Ball Bearing Applications

While twenty years ago ball bearings were generally known only in bicycles, today they are used in almost every industry. Indeed many machines, or developments in machines, owe their very existence to the modern ball bearings, some excellent examples of this being the Dumore precision grinder, the eleven thousand r.p.m. wood-working shaper, the Sperry gyroscopic compass and the Sperry gyroscopic stabilizer for aeroplanes. The rotor runs at 8,600 r.p.m on the Sperry compass, and at 14,000 r.p.m. on the stabilizer.

As the field of ballbearing applications is now so broad and the number of proven successes so great, it is impossible to give even a summary of them in an article of this nature. It will be sufficient, therefore, to select a few examples at random, not because they possess greater merit than others, but because they happen to come first to mind.

Nearly all types of electric motors have been ball bearing equipped, and in no case have they failed to show a distinct advantage over the old plain bearings. An analysis of the records of such motors shows that fewer repairs are required, longer periods can be allowed between motor inspections, and the while cost of maintenance is considerably decreased. The extent to which this

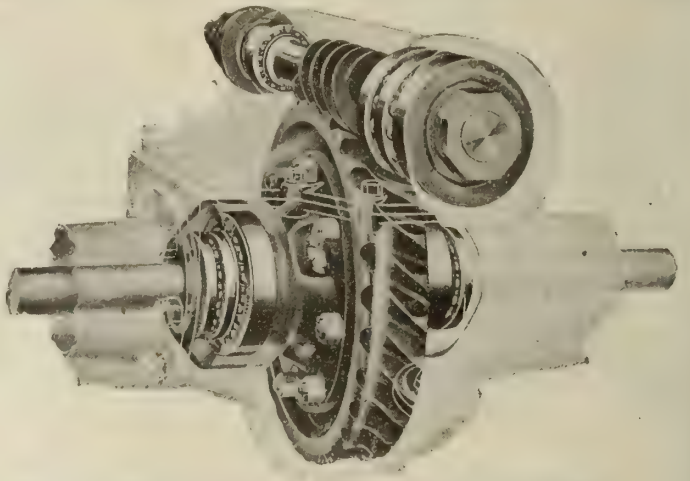

FIG. 18—WORM DRIVE EQUIPPED WITH BALL BEARINGS.

plies in car lighting generators is cl shown in the following testimony superintendent of inspection of one o largest railroads in the United St He claims that due to ball bearings cost of generator maintenance has reduced on coaches 66 per cent. ar diners 46 per cent. He has never hot bearing, never lost a field or a ture, the inside of the generator is and he has had no trouble due to gr or short circuits. Truly this is markable record when it is remem the severe conditions under which lighting generator is called upon to ate—exposed to snow and ice, heat and water, and the jolts and shoc passing cross-overs and switches.

Owing to the precision of a ball ing and its freedom from wear, the ing adjustment remains constant ar the rotor is kept in the centre of the netic field. This permits the motor ufacturer to employ air gaps with

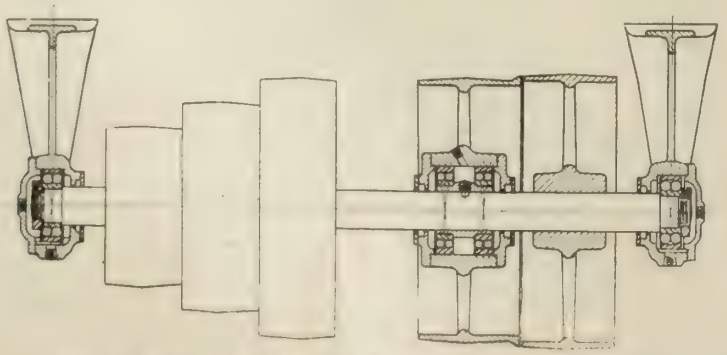

FIG. 20—TYPICAL EXAMPLE OF BALL BEARING HANGER.

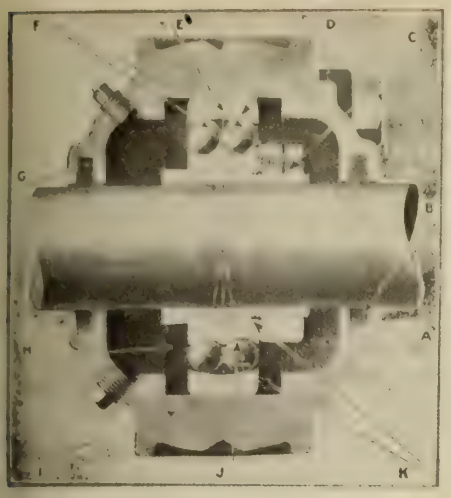

FIG. 21—CONSTRUCTION DETAILS OF BEARING CASING.

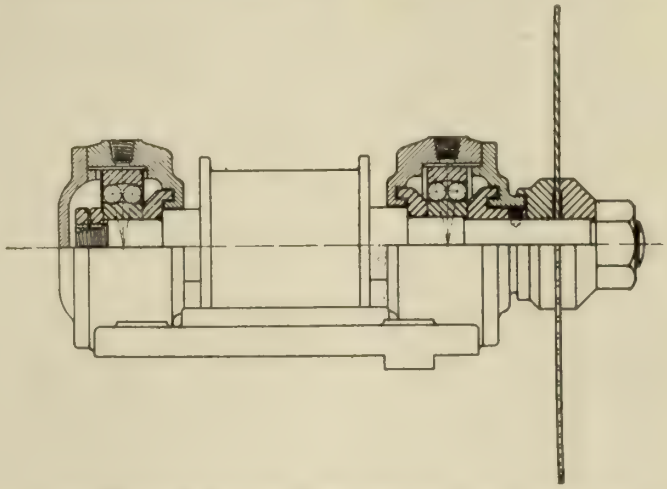
ances so slight that they could not be considered on motors having any other type of bearing. On induction motors a close air gap is of vital importance in the improvement of the power factor and the machine efficiency. A ball bearing equipped motor is shown in Fig. 16.

Fans or blowers, such as that shown in Fig. 17, provide an excellent example of what ball bearings will do in the way of improving the equipment of the average plant. Owing to the high speed at which they are driven they are a constant source of trouble and expense, but, as has been proven for years now, ball bearings not only reduce the friction load but eliminate all bearing trouble as well. The change is usually a simple one to make, it being necessary only to bolt a ball bearing pillow block on the frame from which the plain bearing has been removed.

With regard to the automobile, little need be said as its present success is made possible by the anti-friction bearing. Fig. 18 illustrates a worm drive on ball bearings.

Fig. 20 depicts a countershaft equipped with ball bearings. All necessary information can be secured from this view, so let us pass on to Fig. 21, which gives the constructional details of the bearing casing used in the installation shown in Fig. 20.



The points to be noted are the large lubricant chambers at A (sufficient for several months' running) and the method of rendering the housing oil-tight and dust proof by using a sealing groove containing a stiff felt washer as shown at B. This washer closes on the shaft and effectively closes the opening. It should be remembered that there is enough give in the washer to allow for any deflections of the shaft in the self-aligning bearing, and that the casing is thus kept oil tight under all conditions of shaft deflection that will be met with in practice.

The split sleeve and locking nut is shown at C, while D illustrates the self-aligning feature. E illustrates the outer race, while F depicts the principle of the two rows of balls, viz., the least load per ball. G illustrates the other sealing groove, while H shows how the bearing is open at both sides, permitting a positive circulation of lubricant. I denotes the bearing casing, while J illustrates the one-piece ball cage. The last letter K depicts both the outer and inner race.

The construction of the loose pulleys mentioned is clearly shown in the line drawing, Fig. 22. Two radial bearings are mounted on a steel sleeve, which is held to the shaft by a set collar and used to locate the pulley in position. The design is simple and provides a large lubricant chamber between the bearings, sufficient to hold enough grease for six months' running. The end caps keep out the dirt and prevent the escape of lubricant. The pulley is strong, well balanced, and will carry any belt at any speed without running hot.

An application of interest to all woodworking plants is the circular saw arbor shown in Fig. 23. The high speed and heavy load impose a severe duty on the bearings, but these conditions are easily taken care of by ball bearings, if the bearings are properly protected. The distinctive feature of this design is the labyrinth type of packing used to prevent the leakage of oil and the intrusion of dirt. The rings fit against shoulders on the shaft and are let into the housing. The inner race of the left hand bearing is locked against the ring by means of a nut and covered in by an end cap. In the right hand housing a ring is pressed against the inner race of the bearing, the ring being held in position by a set screw.

Another application to woodworking machinery, which has been revolutionary in nature, is that of ball bearings to the spindles of high speed shapers. By this means, shapers have been developed until now they can be run successfully at 11,000 r.p.m. High speed ball bearing shapers will turn out about twice the work of a plain bearing shaper and do it better. Very often the work is of such fine quality no sanding is required. This is important because sanding means considerable expense, and in connection with

CIRCULAR SAW ARBOR MOUNTED ON BALL BEARINGS.

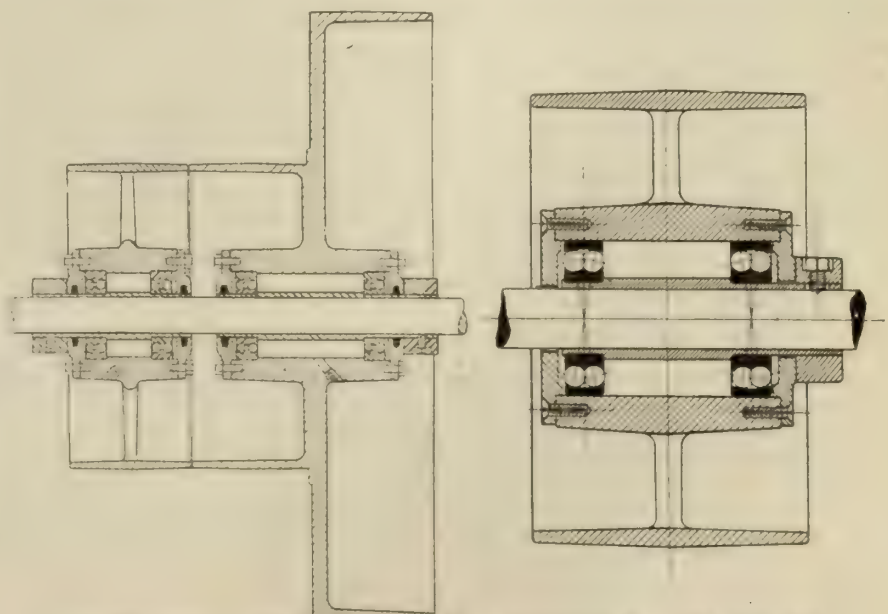


FIG. 22—TYPICAL INSTALLATION OF BALL BEARINGS TO LOOSE PULLEYS.

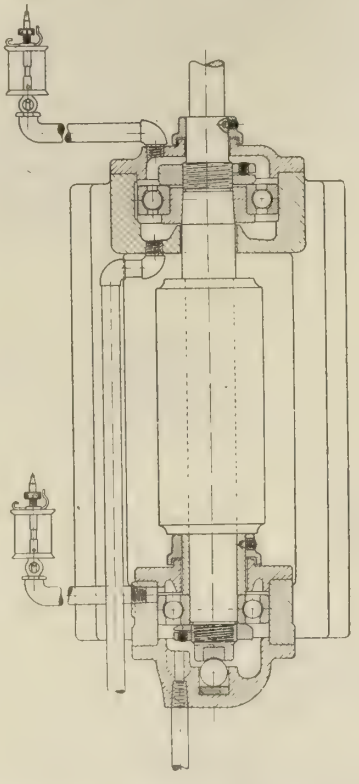
shaper work it often amounts to twice the cost of the work itself. As will be seen from Fig. 24, the mounting is very simple, the spindle being steadied by means of two radial bearings—one above the pulley and one below. The weight of the spindle or thrust is taken on a ball at the lower end of the spindle. Great care must be exercised to see that the spindle and pulley are accurately balanced, as, otherwise, at the high speed employed, the vibration will become excessive.

### Grinder Installations

Figs. 25 and 26 illustrate two types of mountings for precision grinders where elimination of chatter is a necessity. The first illustration shows a high speed precision grinder spindle with a take up feature which eliminates any possibility of chatter; two radial bearings on the wheel end of the spindle being pressed against each other on the outer raceways. This mounting is suitable for high speed grinding where endless belts are used. It is necessary in this case, that there be no joint in the belt, as this would cause shock to the spindle.



The second illustration is an application for a large precision grinder spindle; two bearings on the wheel end being adjustable against each other on the outer raceways to eliminate chatter. The bearing on the other end has to carry only the weight of the spindle. The driving pulley is carried separately by two radial bearings and the spindle is driven from it by slots or grooves in the shaft. The reason for mounting the pulley separately from the shaft is so that any shock from the belt joint cannot be transferred to the spindle. Both of these grinder designs are covered by patents.

Another illustration of ball bearing application to machine shop equipment is shown in Fig. 27, which is an excellent example of a ball bearing lathe head. The drawing which is a cross section through the headstock of a single purpose lathe, shows the method of mounting the ball bearings. The large radial bearing is locked against a shoulder on the spindle by means of a nut, thus holding it in position. The housing for this bearing has two felt washers on the outer end, and one on the inner end to prevent chips and dirt from getting into the bearing, and the lubricant from getting out. The cone pulleys are carried on two radial bearings held in position by means of a short and long sleeve and a locknut. The housing at the right hand of the headstock contains a radial bearing for carrying the spindle and a thrust bearing for taking the entire end thrust on the spindle. It will be noted that the radial bearing is locked against a shoulder on the spindle by a nut. One ring of the thrust bearing is mounted against a shoulder on the spindle, while the other, which has a spherical seat and is self-aligning, engages with a steel washer let into the end cap. The back gears are also carried on radial ball bearings.

These examples could be extended indefinitely, but space forbids. It may be stated generally, however, that wherever high speed is encountered or reliability is essential or power saving is a consideration, ball bearings should be adopted.

### Lubrication of Ball Bearings

Oils as well as greases may be used as lubricants for ball bearings. If oil be used, the housing of the bearing should

WOOD SHAPER SPINDLE EQUIPPED WITH BALL BEARINGS.

be filled up to about the centre of the lowest ball. If grease be used, the housing should be filled about one-half to three-quarters. On account of the fact that lubricants, particularly greases, which are sold under trade names, show great variations in composition and quality, it is advisable that lubricants for ball bearings be purchased according to specifications and not according to trade names only. Below are given a number of such specifications, which are designated A, B, C, etc.

**"A"—Very Light Ball Bearing Oil**

| | Maximum |
|---|---|
| Free Acid | .10% |
| Free Alkali | .10% |
| Sulphur | .03% |
| | Maximum |
| Ash | Trace |
| Resin | None |
| Salt | None |

Heat Test (15 min. at Flash Point) Darkening, but no sediment—slight.

Oil should be pure, mineral and have no tendency to gum or become sticky.

| | Minimum |
|---|---|
| Flash Point (Cleveland Open Cup) | 300°F. |
| Fire Test | 350°F. |

Viscosity (Saybolt from 50 to 100 secs. at 100° F.

"B"—Light Ball Bearing Oil. Same as "A" except Viscosity (Saybolt) from 100 to 200 secs.

"C"—Medium Ball Bearing Oil. Same as "A" except Viscosity from 200 to 300 secs.

"D"—Heavy Ball Bearing Oil. Same as "A" except Viscosity from 300 to 500 secs.

"E"—Extra Heavy Ball Bearing Oil. Viscosity from 500 secs. or above.

"F"—Same as "B" except that in addition Pour Test—5°F.

**"G"—Grease**

| | Maximum |
|---|---|
| Free Acid (calculated as oleic acid) | .10% |
| Free Alkali (calculated as sodium hydroxide) | .10% |
| Free Lime (calculated as Calc. Oxide) | .10% |
| Sulphur | .03% |
| Resin | None |
| Salt | None |
| Neutral Saponifiable Oil | 1.00% |
| Abrasive particles (sand, etc.) | None |
| Melting Point, about | 180°F |

Grease should have no tendency to gum or become sticky. It should not contain graphite or fillers of any kind.

### Selection of Lubricants

As a general guide, the following considerations may be useful:

1. For very high speed, say over 3,000 r.p.m., use a light oil, such as "A" or "B." If the surrounding temperature exceeds 150 degrees Fah., oil "C" may be used.

2. For speeds from 600 to 3,000 r.p.m., use oil "B" or "C." If the surrounding temperature exceeds 150 degrees Fah., oil "D" may be used.

3. For speeds from 100 to 600 r.p.m., use oil "C" or grease "G," or if surrounding temperature exceeds 150 degrees Fah., oil "D."

4. For speeds below 100 r.p.m., use oil "D" or grease "G," or if surrounding temperature exceeds 150 degrees Fah., oil "E."

5. For temperatures below 32 degrees Fah., use oil "F."

Grease should be used when, on account of local conditions, it is difficult to keep oil in the bearing. It is not generally recommended where the speed exceeds, say 600 r.p.m., or where the surrounding temperature may attain 140 degrees Fah. or above. The consistency of the grease to be used depends on the conditions of operation. The necessary con-

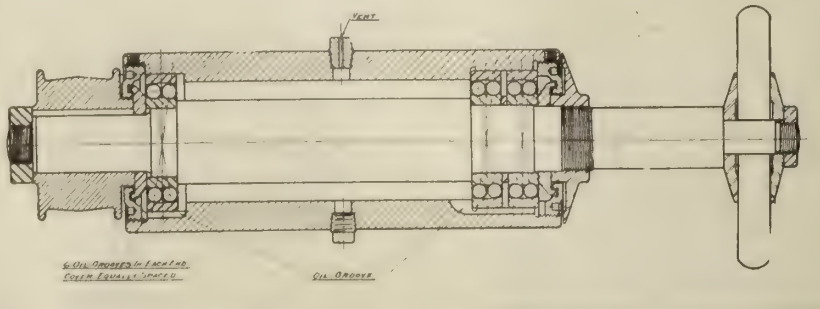


FIG. 25 BALL BEARINGS AS USED ON PRECISION GRINDER SPINDLE.

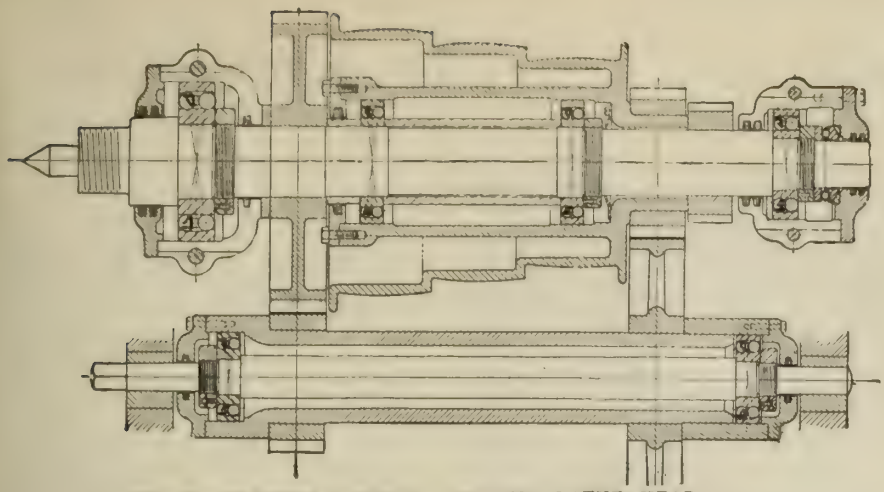

FIG. 27—EXAMPLE OF BALL BEARING LATHE HEAD.

sistencies in numerical values cannot be specified until a satisfactory testing method has been agreed upon by the trade.

The above speeds refer to bearings of an average size of 2-inch bore. If the actual size is greatly different, the speed of the bearing should be divided by two and multiplied by the actual shaft diameter. The speed so obtained should be used as a basis for selection of a lubricant.

### Application of Lubricants

The renewal of the lubricant in a ball bearing depends to a great extent upon the operating conditions of the machinery. In the ordinary type of installation, operating under normal conditions, renewal should be made about three times a year, although close observation for a short time after installation will enable a better estimate to be made of the proper period of time.

When feasible, in cleaning the bearings, the old oil should be removed, the drain plugs then inserted and the housing filled with kerosene. The drain plugs should then be removed and the housing carefully drained.

The drain plugs should again be inserted and the housing filled with a small supply of the proper oil. The bearings should then be rotated for a few moments and then drained in order to be certain that the last traces of kerosene have been removed. After this second operation, the housing should be filled with the correct grade of oil to the proper level, and the bearing is ready for operation.

Care should be exercised to avoid putting too much grease into the housing, as this will result in its being forced out through the packing. In cleaning a bearing lubricated with grease, it is advisable to wash the parts thoroughly first in kerosene, and then with some good light bodied oil. The bearing may then be reassembled and packed with grease. In case the bearing contains a residue of soap that cannot be removed with kerosene alone, it is advisable to use a hot mixture (not over 150 degrees Fah.) of kerosene and denatured alcohol.

The Lakewood Engineering Company, Cleveland, Ohio, announce the appointment of Kelley Powell, Ltd., 403 McArthur Building, Winnipeg, Canada, as agents for the Provinces of Manitoba, Saskatchewan, Alberta and Western Ontario, for the sale of Lakewood paving, construction, and industrial equipment.

### A SAVING OF 50 PER CENT.

A rather interesting use for the photostat has recently come to our attention. H. B. Freeman, managing art director of Vogue, states as follows:

"Before adopting the photostat, layout work in our art department was done by the system of diagonals, and measurements commonly used to layout a page containing photographs and drawings according to specifications. This consumed time, and four days, often more, was required to get complete page material into the printer's hands. With the photostat we accomplish the same work in two days.

"For example: the page has four photographs and two drawings, and it requires titles and captions for every subject. The photostat makes a negative of each subject. Then positives in sizes governed by the initial rough layout. These subjects are then assembled, pasted on a dummy sheet, and arranged to best advantage. Titles and captions are marked in proper positions. The page is then complete.

"Next, a positive is made from a negative of the entire page. This goes to the engraver and serves as a guide as to position, crop marks, and sizes of copy. The original dummy goes to the editorial department for captions and titles. The dummy then goes to the printer's, where the titles and captions are set in type and positioned to receive the cuts when they arrive. Thus, every operation is independent of the others. That is why the time previously required has been reduced 50 per cent.

"Any changes can now be made at the small cost of another paper print. Remaking an engraved plate at a much larger expense was previously necessary. From this one example you can see how expensive several re-orders each issue would be. A year's total would give a rather large figure—a good reason for serious consideration of the practical value of this method."

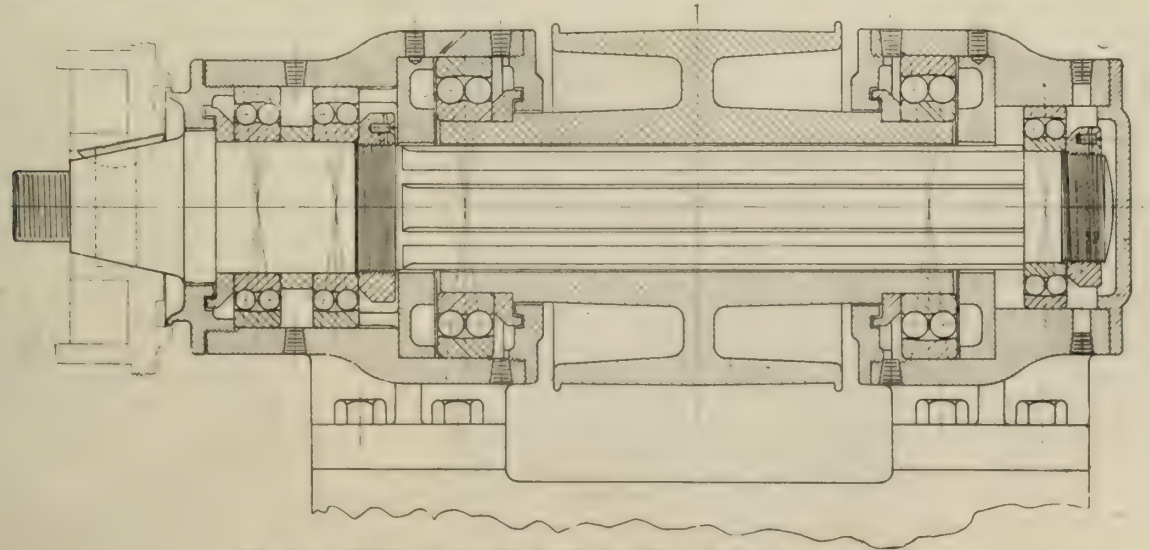

FIG. 26—A TYPICAL EXAMPLE OF GRINDER SPINDLE MOUNTING.

# *Apprentices Should Learn Trade Thoroughly*

*By PETER MASTERSON, Foreman of Tool Department, International Harvester Co., Ltd., Hamilton*

"I BELIEVE in being a pal—rather than a foreman to my apprentices." This, in a nutshell, is why Peter Masterson, foreman of the tool department at the International Harvester Company, Hamilton, Ontario, has made such a success of his position. He has held down his job for the past fourteen years, and is known, not as Mr. Masterson, but simply as "Pete." He is always open for suggestions, in fact is mighty glad to get them, with the result that he is a pal with his men as well as with his apprentices. No one takes advantage of his friendliness, and his orders are obeyed to the letter, not through fear of discharge, but because the men take an actual delight in pleasing him.

"What's your opinion of the possibilities in the machinist trade at the present time?" asked Canadian Machinery, "and how, in your opinion, should an apprentice be trained, that is, to make a real mechanic of him at the finish?"

"That's a large sized order you've handed me," countered Pete with a smile, "but I'll answer it to the best of my ability. First let me speak of the possibilities in the trade at the present time. To my mind they were never better. The young man of today has a wonderful chance. He has the privilege of working with the most up-to-date machine tools; he is given better and finer work than the old timers ever received, and what's more he is given better instruction than was possible in the old days.

"If you will pardon the personal reference, here is what I mean. When I was an apprentice my life was no bed of roses. I was continually bickering, for as soon as you proved adept at some particular machine, there they wanted to hold you. I remember on one occasion I had to walk for my coat and hat before I gained my point. I had just succeeded in being transferred from the lathe to the assembling department, but my success was apparently going to be short lived, for along came the superintendent a few days afterward with the order that I was to go back to my old job on the lathe.

"'Why do I have to go back?' I queried.

"'Because you're told to,' came the reply, 'and what is more, you're the only one familiar with the job we want.'

"It was a show down pure and simple, and I realized it.

"'All right,' I said, 'I guess I'm through. If you won't give me a chance to learn the different angles of the business, I guess I'd better get out and learn it some other place.'

"You can imagine the look on the superintendent's face, and off I walked for my coat and hat. There is no need of going into the details. Enough to say I won my point, and stayed in the assembly department, but I merely tell the story as one incident in my rather checkered career.

PETER MASTERSON

TO tell the complete story of Pete's career would read like a dime novel. Enough to say he started in the usual way by becoming an apprentice, but refused to follow the work at the usual pace, with the result that he was making tradesman's wages long before his time was out.

By persistent plugging he has now reached a position where he can guide the career of others, and is doing so to the best of his ability. Let any young fellow show Pete signs of ambition, then watch him bring it out. The boys like him, and he likes the boys. This, briefly, is why he is a success, and a real pal to men and boys alike.

"I was anxious to get on—in fact was determined to get on, no matter what the cost. The necessity of thus asserting yourself, however, is over. The apprentice of today, except perhaps in a few isolated cases, gets a real chance to learn the business from one end to the other."

"How were wages in those days?"

"Wages!" laughed Pete. "Well, the least said about them the better. Even the full fledged journeyman made only $1.80 per day, so guess for yourself how many cents I made per week.

### Technical Chances

"Then look at the technical chances at the present time. Take the first class technical schools. The apprentice can go to such schools as many nights a week as he cares to—and all free, or at least practically so. If he attends all the classes he gets his fees returned. The very best of instructors impart information that will stand him in good stead, and at the same time increase his earning power."

"Then you thoroughly believe in such schools?"

"Most assuredly," came back the answer. "The man or boy who doesn't believe in them has something wrong internally. You know, our boys here are sent up to the technical school half a day each week. The firm pays their regular wages, and even though they do this, it's funny how some will try to skip instruction, or in plain words, play hookey. Of course such boys are the exception—and we soon find them out. In fact, each apprentice must sign his name on a sheet as he enters the school, and the time of his entering and leaving are noted on the same sheet. I receive these reports at the office, and of course have an actual tab on every boy.

"I remember one particular case of a lad who looked as if he had the goods, but who would persist in playing hookey. I hated to let him out, for his father who worked for me was a real mechanic, and I felt the son had it in him too if he would only settle down to school. His work at the plant was splendid, so I decided to have a chat with his father about it. When I told him that his son had been skipping instruction he went higher than a kite and promised to wipe the floor with him. In fact, I had some trouble in holding back the exhibition right in the department, but finally I persuaded him that such a procedure would only make matters worse.

"After some further discussion I decided to try diplomacy. I got this prodigal aside and in a quiet way talked the matter over. I put it straight up to him that if he wanted to be a success he would have to do some home study, attend the technical school, and learn mechanical drawing and mathematics. Soon he began to see my angle of it and admitted that there might be something to this study stuff after all. Having gained my point, I did not follow it up by a lecture, but told him how glad I was he had seen it my way and we parted the best of friends. Today that boy is as good a worker as I have, and before you leave I'll let you have a chat with him, so that you can form your own judgment."

"His work at the school—how is that coming along?"

"Fine,—in fact I'm glad you raised that point, for I've got a hobby, if you might call it so, in watching the char-

*WORK THAT WAS OVERDONE*

*Here is a story that Mr. Masterson swears is true, and should serve both as a story and an object lesson.*

*"I remember a funny experience that happened to an apprentice—one of the type who would persist in roaming all over the shop while his machine was feeding. On this particular day he set his boring tool in position to bore out a rather long hole, slipped in the feed, then went a-visiting—but—he roamed too long.*

*"Imagine his surprise to find on his return that the tool had done its work well—in fact, too good, for it had not only bored out the hole, but the chuck and lathe spindle as well, the result being that the chuck, work and part of the lathe spindle rested gracefully (?) over the boring tool, while the machine was still feeding right merrily.*

*"Luckily, this apprentice had vision enough to imagine what was going to happen him, so without giving the foreman the trouble of discharging him, he secured his coat and hat, left the plant, and has never been heard from since."*

acter of each boy from his drawings that are completed at the school. The character of each individual stands right out of the drawing. If the boy is careless by nature his drawings are smudgy, sort of semi-finished, and lack the touch of the neat, painstaking worker who must have everything perfect before he calls it a day.

"To show you that we give the boys every chance to succeed, let me tell you two rather interesting stories. Some time ago the foreman of our bolt department said to me, 'Say, Pete, the first time you have an opening for an apprentice let me know. I have a young fellow in my department who is too good to stay there.'

"On the first opening occurring, I went down, had a talk with this young chap, and although he was doubtful about making the change, I signed him up. This fellow had no special education to speak of, yet by home and school study, plus the instruction he received from us, he developed into a splendid mechanic. He had it in him. We merely helped to bring it out.

### Taking a Chance

"In telling the next story, I'm sort of taking a chance, for some foremen may not agree with me. However, in my own mind I am fully convinced that my viewpoint is correct, so here goes the story.

"Some time ago I had a young apprentice working for me that showed great promise of success. He was always eager to learn, and I often invited him up to my house when we would continue his lessons in the quiet atmosphere of the home.

"Of course, neither he nor I discussed these meetings in the shop, for had we done so, I feel sure the rest of the boys would have thought he was a sponger. The real cause of his friendliness was his desire to learn more, and never once did he presume on that friendship. I tell this story because I want some young fellows to read it—then lose this idea of sponging. Go to your foreman, ask his advice and if he is the right kind, he will give you all the help he can, without ever considering you are sponging, or presuming in any way. Of course there are a few foremen, a very few, who would resent an apprentice bothering (?) them, but luckily the variety are dying out. The day of the driver is gone. I never bawl a man out in public. He resents it, and it doesn't do any good. Get a man to one side, tell him frankly if you have a grievance against him, and you've made still another friend, contradictory as it may seem.

"Then there is the question of technical literature. To my mind this is a very important aid to success. More reading of such magazines as the one you represent would aid apprentices, machinists and tool makers alike to keep up to date. I wish I could hit this point home to every mechanic, especially the apprentice, who is really the mechanic of the future."

Mr. Masterson is of the belief that specialization can be carried to extremes. As he so aptly put it, "The amount of specialization depends entirely on the nature of the work being produced." An apprentice should learn how to operate different machine tools, also fitting work, but if a journeyman decides to become a specialist on some particular machine—well, that is his own business. As long as specialization is looked at from the viewpoint of production it will continue irrespective of our opinions.

"In one plant that I know of, this spe-

*RIGHT FROM THE SHOULDER*

*"As I have told you already, I believe the day of the driver is gone," said Mr. Masterson. "But here is a rather humorous tale to show that even a bulldozing foreman can have a saving grace of humor.*

*"This particular foreman was about the worst grouch I ever met, and was continually nagging and threatening his men. They lived in terror of his ways, and used to warn each newcomer what to expect. One day, however, in came a chap who was extremely anxious to please the boss—and on being told by one of the men to watch out for old grouch, etc., he promptly went and told the foreman what had been said about him.*

*"It looked bad for the workman who had meant well in warning the tyro, and soon the three interested, namely, the foreman, new man, and informant, were all assembled in the one room.*

*" 'Did you tell this guy I was no good, a bulldozer, a grouch, etc.?' thundered the foreman."*

*"The poor worker had visions of losing his job, and jobs were none too plentiful at that time, but he decided to brave it out. 'I did,' he replied, 'and what's more, you're all I said you were.'*

*"The foreman growled in his throat, then said: 'Well, be that as it may—let him find the —— thing out for himself. Go back to work.' And he did, but strange to relate, the foreman was never so grouchy as he had been before to that particular chap."*

WHY COMMENT ON THIS PICTURE? IT SPEAKS FOR ITSELF. PETE STANDS IN THE CENTRE, WHILE THE FOUR HUSKIES IN VARIED ATTITUDES ARE THE APPRENTICES WHO WERE PRESENT WHEN THE WRITER CALLED.

cializing is carried to the extreme. A considerable number of die sinkers are employed; in fact the majority of their help is of this branch of the trade. Suppose a new man applies for a position, claims he is a die sinker, and is told to come into work in the morning. On arrival he is placed in a corner by himself, not with the regular workers, and there he must work out his destiny, namely, prove his worth without help of any kind. Providing he makes good, both as to quality and speed, he is moved beside the other men. Should he be of only average value he is gently but firmly shown the door. This, to my mind, is specialization carried to the point of being ridiculous.

"A new man entering our employ is not handed the hardest job first, but is given a chance to find himself. Some men are naturally nervous at the start and do not display their best work until accustomed to the surroundings. It is my contention that if you give a man a chance he will do better work in the end. In other words, have confidence in the men, and they in turn will have confidence in you. But let me stop at this point and take you out to see a few of the lads who are serving their apprenticeship. There are only four here today, as we split things up to let some go to school, others to stay and work, this preventing any severe change in our department, as far as the operation of the machines is concerned."

### The Boy's Viewpoint

The first one spoken to was a fellow called Turner.

"What do you think of the school idea?" we asked; and back came the answer, "Fine. I wouldn't be without the school training for anything. It has helped me wonderfully, and I can see the advantage of it clearly."

The second boy, McDougall, had a similar story to tell, and was especially thankful to the school for the help it had given him in fractions. "You know," he said, "I had forgotten all about fractions until I went back to school, and of course it is mighty handy, in fact necessary in my work."

"What studies do you cover?" we asked.

"Drawing and arithmetic of all kinds. In the drawing lessons we first of all make a sketch from some object, such as a casting for some machine. This is then taken away and we have to make a mechanical drawing from our sketch."

The other two chaps were of like mind, and one of these was the fellow who used to play hookey. He grinned sheepishly when we jollied him about it, but admitted he was now a strong booster. Decimals was his Jonah, until he went back to school, but now he has got them securely by the neck.

Every one of these boys, without any prompting, spoke of the value of the school in helping them read drawings. Each had his own way of putting it, but briefly here was the consensus of opinion —that they could now read a drawing quickly and intelligently, whereas before it looked Greek to them.

"You see," remarked Pete, on our returning to his office, "what I told you is absolutely true. Each of these boys is a booster and the others could tell the same story were they here. To my mind the profession is far from overcrowded and the benefits to be derived warrant a boy entering it. He should never be forced to enter it, merely because his father was a mechanic. He must first of all have a natural liking for it. As to the future, I believe it holds wonderful possibilities for the young fellow who really tries, and decides in his own mind to be a success."

## STRAIGHTENING A ROTOR SHAFT

By D. A. HAMPSON

The method of straightening a rotor shaft described in the February 10 issue is both novel and instructive; it is one that should suggest a way out of other ticklish straightening jobs. There is no question but that there are unrelieved stresses in a shaft so repaired—if there is a suitable factor of strength in the original shaft and if the service is not fatiguing, no harm will result. The conditions under which a repair is performed often make it necessary to violate the teachings of theory, but if results are the true test of engineering, then such repairs must constitute good practice.

Some time ago a screw was brought into our place to be straightened. It was a piece of steel twenty feet long over all with fifteen feet of square thread, single, having a pitch of one inch and an O.D. of three. This screw was part of a special machine and moved a heavy carriage back and forth. Something had blocked the carriage and the screw, making 200 R.P.M., had bent close up to the nut. It was a job we did not want to do for obvious reasons, and we frankly told the customer so, but he did not want to send it away to the people who made the machines and he agreed to pay well for the time and accept all risk.

There was no lathe within forty miles that would take the length or over half of it, but we had a planer with a fifteen foot table, and by placing the screw diagonally (to dodge the slots), we were able to roll it on the top for sighting purposes. It was not hard to pick out the bend—a straight-edge would do that —but it is always of great assistance to rotate a piece being straightened.

Actual straightening was done by putting the bend down, with a block under this part to raise it half an inch from the table, and then drawing down on clamps on each side of the spot. The planer was a heavy one and we had no fear as to which piece would go first. Our fear was that we would get too far, and, worse, would get a reverse bend alongside the original one. To be safe, we bored out a piece of cast iron to three inches, and sawed it up into three pieces, putting a short section under the screw and longer ones under the clamps.

A swaging tool was also forged out and fitted to the space and curve between the threads. This was used to force back the metal where it had been compressed, thus assisting the clamps as pulled down, and putting a stress of compression in the metal where there would otherwise have been only the tension due to drawing the screw back to a straight line. As the clamps were pulled down, this swaging, or peening, was carried on—greatest at the point of bend and tapering off in amount for a couple of threads each side.

After a cautious trial of this scheme, followed by more confident repetitions, we pronounced the screw commercially straight. Indeed, it was a first-class job and surprised us ourselves. There was a certain amount of stretch at the critical point, that we knew, but as it was not discernible with a rule and showed up only when calipers were applied, we thought there would be no interference in passing through the nut—and luckily there was none.

Editor's Note: This is the style of short articles we like. Snappy and to the point—yet imparting information of real value to the mechanic. Let us hear from others, not only on the subject of straightening, but about any unusual repairs.

## LACQUERING METALS

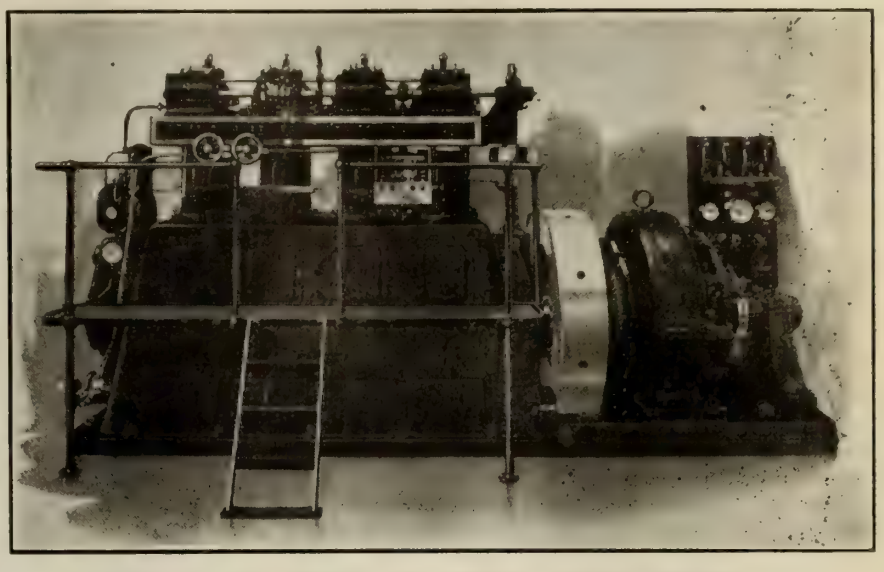
Occasionally tin and other white metals are required for decorative purposes, remarks Practical Engineer. Should a yellow be desirable, plus some degree of brightness, the following lacquers will prove very useful. Steep 2 oz. of turmeric (coarsely ground) and ½ oz. of gamboge in two pints of clear methylated spirit for about ten days and then add 2 oz. of pale shellac. When the shellac is dissolved strain it through fine muslin and use. Or take mastic in tears 1 oz., gum sundarac 1 oz., gum elerni ½ oz., gum animé ½ oz., and dissolve in one pint of clear spirit, and add gamboge, or soluble extract of saffron, or annatto previously dissolved in spirit, the amount depending on the color required. The articles to which the lacquer is applied must be quite clean and free from grease, and the coating should be applied in a warm apartment free from floating dust.

**New Branch.**—It has been announced by the W. S. Mahaffy Company, Gladstone and Trafalgar Avenues, Toronto, that they are operating a new department known as the Ornamental Iron Products Company. H. Harlander, former superintendent of the Canada Foundry Company, and for twelve years with the firm of John Williams, Inc., New York, is in charge of production.

# The First True Diesel Made In Canada

## The History of the Diesel Engine—Two-Cycle, Four-Cycle, Solid Injection and Atomised Injection—General Description of the D. S. P. 100 B. H. P. 4-Cylinder Diesel

THOSE people who were interested in the exhibits shown in the Machinery Hall at the Toronto Exposition last year doubtless all stopped for a more or less interested look at a new kind of engine. This was the 125 h.p. Diesel exhibited by the Dominion Steel Products Co. of Brantford, and the first of its kind to be built in Canada. It is of the full or true Diesel type, as distinguished from the hot bulb or other surface ignition engines. This type of engine will doubtless have a great part in the developing of some of the outlying parts of our country, and every engineer should understand its principles and operating features.



### The History of the Diesel

The Diesel engine should really be known as the Ackroyd Priestman engine, as the cycle it works on was first mooted by these two engineers in England, some years before Dr. Diesel took up the study of this principle. However, Dr. Diesel is usually conceded to be the man who first actually demonstrated its possibilities, and the basic patents were taken out by him in 1892. He built his first engine in 1893, and this was driven by a belt and did not do any work. What it did do, however, was to prove that oil could be ignited by the heat of compression of air, which is the main feature of the true Diesel engine. In the experimental engine, Dr. Diesel obtained a pressure of 1,350 pounds per square inch, and incidentally when the fuel was injected, the explosion that followed wrecked the engine. It almost resulted in the death of the inventor, but he rose from the ruins triumphant, for, even if the engine was demolished, the principle was established that the fuel could be ignited by means of the heat of compression.

Another engine was built, this time the compression being kept down to 500 pounds per square inch, and on this occasion the full cycle was obtained. Later another engine was built, with the cylinder water cooled, in 1896. Dr. Diesel sold his patents in 1897 for the sum of $1,500,000, so unlike many inventors, he actually realized the reward of his endeavor. His life ended in a tragic manner, he being lost at sea while journeying from Antwerp to Harwich in the year 1918.

### The Cycle of Operation

The Diesel engine is built in two principal types, the two and four stroke cycle. These types are divided again into other modified classifications. In general, the two stroke cycle gets an ignition at each revolution, and the four stroke cycle receives an impulse every second revolution. In the two cycle type, on the inward or upward stroke of the piston, the products of combustion are discharged, and a fresh charge of air drawn in and compressed. At the top of the stroke the fuel is injected, and the down stroke is the working stroke. In this type the scavenging, or getting rid of the exhaust gases, is a difficult problem, and various means are employed to effect it. The simplest, and most generally used, is crank case compression. The piston descending on the downward stroke, compresses the air in the crank case to five or ten pounds, and this air sweeps through ports on one side of the cylinder when uncovered by the piston, and drives the gases out through a set of ports on the opposite side of the cylinder. Enough air is received on top of the piston to give the necessary compression. In other types the scavenging is done by a separate pump. Then there is the opposed piston type, in which the compression takes place between two pistons in one cylinder, and the working stroke is obtained by one piston ascending and the other descending. These work on three cranks, two of them being at 180 degrees to the other. The top piston is supplied with a crosshead, from which two connecting rods are connected to the two cranks at the outside, while the bottom piston is attached to the centre crank. When explosion or ignition takes place, the top piston pulls the two outer cranks up, while the centre crank is pushed down by the bottom piston. This type is known as the Junker, pronounced Yunker. Very often the scavenging in this type is done by a separate air compressor, instead of using the crank case compression.

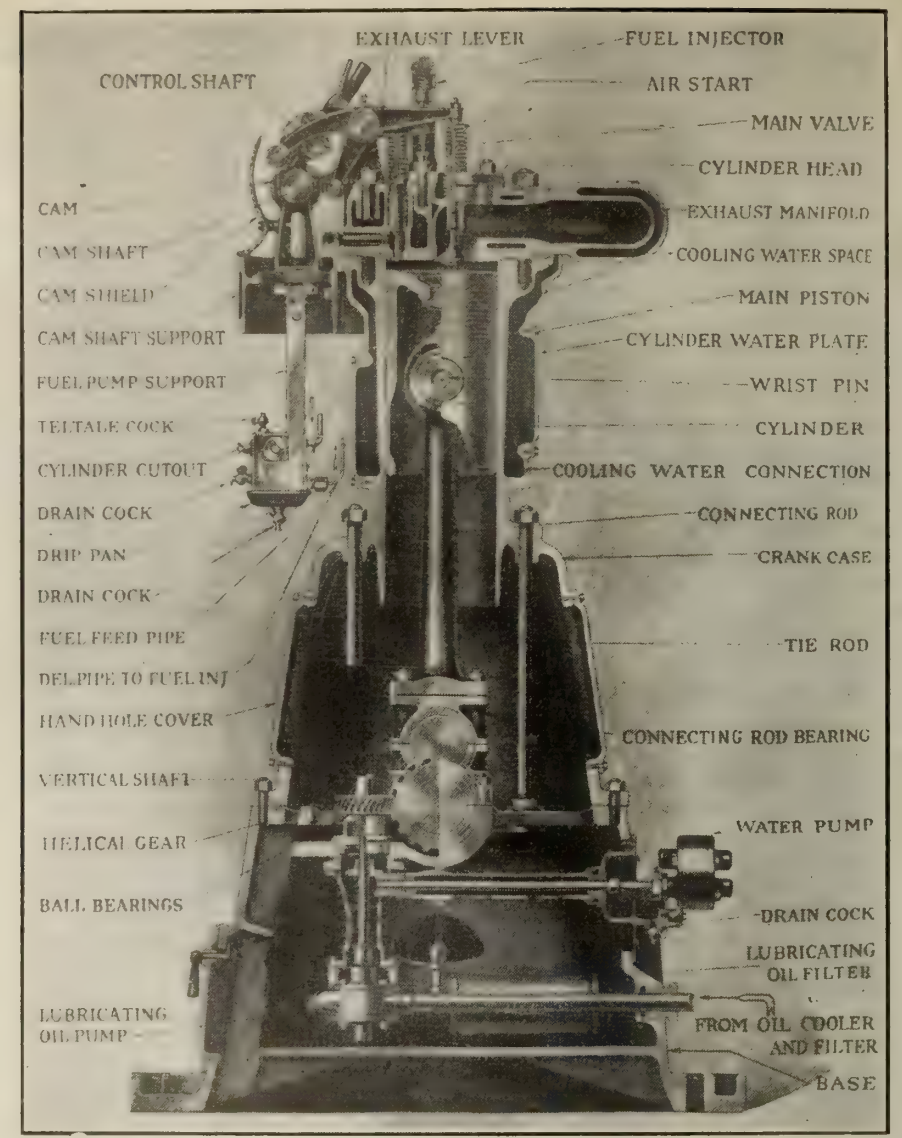
D.S.P. H.C. OIL ENGINE. FOR CENTRAL STATION SERVICE.

The four cycle type is divided into solid injection and air spray injection. In the solid injection type the fuel is injected by a fuel pump working at a pressure of 6,000 to 8,000 lbs., directly into the combustion chamber. In the air spray type, which is the one we are about to describe, the fuel is injected into a chamber containing compressed air at a pressure of about 1,000 lbs. per sq. inch, and shot into the combustion chamber as a finely atomized mixture of air and oil.

The two types have their different adherents, the solid injection school claiming that their method does away with the necessity of an air compressor steadily running, while the air spray school claim better combustion, which amply makes up for any supposed disadvantage from the use of a high-pressure air compressor.

### The Four Cycle Type

In the four cycle type the first downward stroke, or outward stroke perhaps is a better way to put it, draws in a charge of pure air from the atmosphere, not the crank case. On the inward stroke this air is compressed to the required pressure, about 550 lbs., and at the top of the stroke the finely atomized fuel is injected by the air pressure from the air compressor delivery chamber. Ignition takes place at constant pressure, and the third stroke is the working stroke. On the fourth stroke the exhaust gases are discharged through a special exhaust valve and the cylinder is ready for the cycle to be repeated. The cycle may be described as suction, compression, expansion, and exhaust.



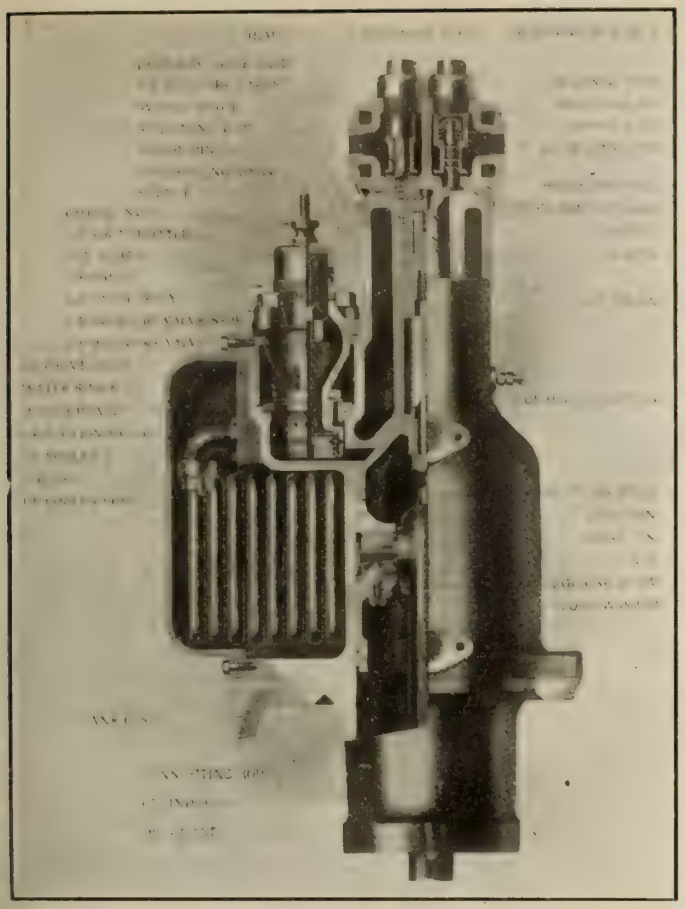
### The D.S.P. Engine

The illustration herewith gives a good

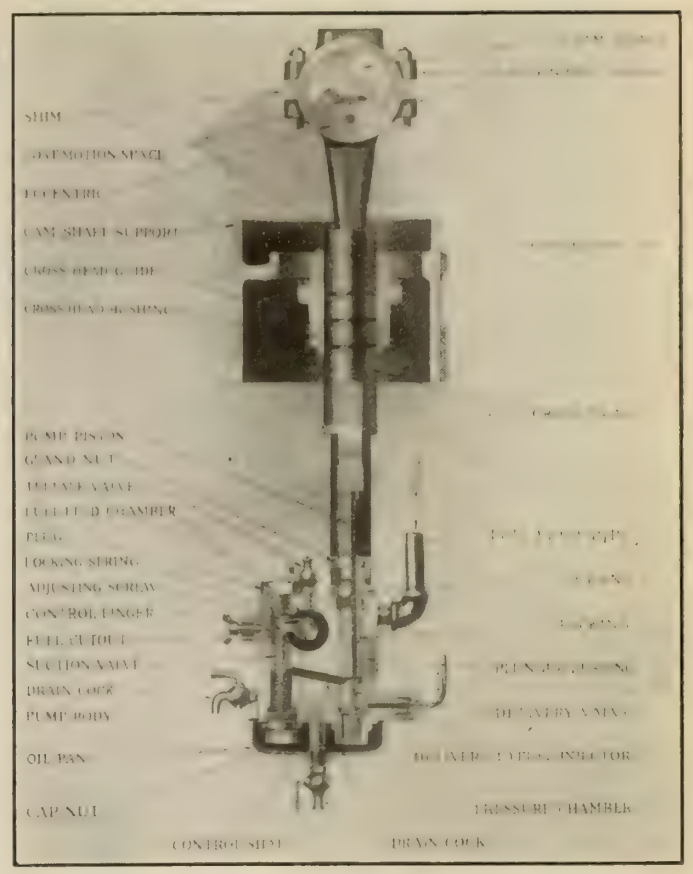
idea of the outside appearance of the engine, directly connected to a generator, for power and lighting service. This is exactly as the engine appears in the shop where it is now engaged in running a number of machines and overhead cranes. The engine is four-cylinder, four cycle, spray injection. On the end opposite the flywheel and generator is the air compressor for injecting the fuel, and supplying the air bottles, which are used for starting purposes. On the front can be seen the fuel pump. Both of these pieces of apparatus will be described fully later on. The engine operates on crude oil, with a specific gravity of about .865, or even higher, but with this specific gravity the oil will flow without heating in to the fuel pump. The efficiency of the engine is high, as it will deliver practically 30 per cent. of the fuel energy at the pulley as useful work. This is, of course, much bigger than with any type of steam prime mover, and is attained in the Diesel engine because the fuel combustion takes place in the same chamber that the work is done in. With the steam engine, the combustion takes place in a furnace, the heat is conveyed through the plates of the boiler into the water, and then carried by the steam through piping into a cylinder or turbine casing, with many losses on the way due to radiation and friction.

In the engine we are dealing with compactness of design has been studied to good effect. It is necessary, of course, in an engine of this type to make provision for starting up. The method of starting is to admit compressed air to the cylinder to obtain the initial revolutions and compression. In order to do this it is necessary to have always a reserve of compressed air, and for this purpose bottles or flasks are provided, much like ammonia or oxygen cylinders. In most cases these are mounted on a wall convenient to the engine, but in the D.S.P. engine, provision has been made for carrying these bottles in the bedplate of the engine. This arrangement makes the engine absolutely self-contained, and ready to start the minute it is dropped down and secured to the foundation, and connection made to the fuel oil supply. The air is supplied to the bottles by the two stage air compressor situated on the end of the engine, and after the engine is started up this compressor supplies the air continually to the air injection valve for atomising the fuel. Such surplus air as may be delivered is diverted to the bottles.

The fuel pump is worked from a small crosshead, which is driven from a special eccentric mounted on the cam-shaft, which operates the valves. There are four plungers on this pump, one for each cylinder. The amount of fuel injected at each stroke is varied by a governor, which operates by holding the suction valve of the fuel pump open for a longer or shorter time, thus controlling the amount of fuel delivered per stroke.



CROSS SECTION THROUGH CYLINDER.



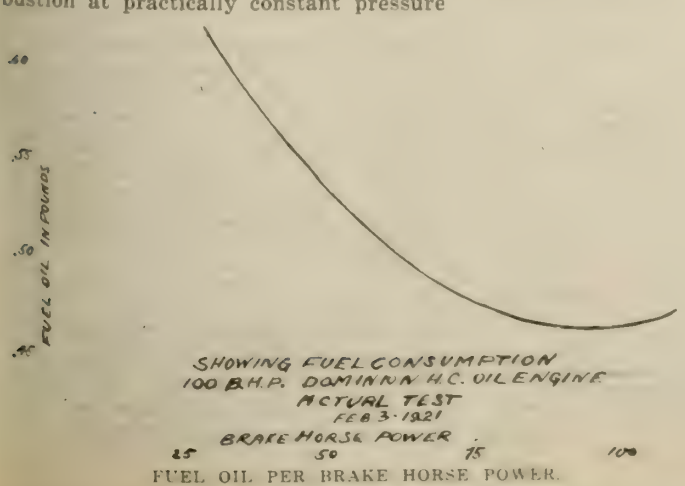
Holding the suction valve open, of course, is the same thing as shutting off the supply, and the speed of the engine is regulated very closely by this means. Each cylinder has the necessary valves for air start, fuel injection, and exhaust, and in addition to these, the two centre cylinders are supplied with air starting valves. These valves can be put on each cylinder if required, and the cylinder head is machined to receive them, but in practice it is only found necessary to use the two mentioned. These valves are all operated from a cam-shaft, driven by gearing from the main shaft. The cams operate levers, which open and shut the valves at the precise period of the stroke necessary to accomplish the various functions. The action of these cams is, of course, exactly the same as on a gas engine or a gasoline engine, with which most of us are familiar these days.

### Starting the Engine

In starting the engine the following is about the method of procedure. The reserve air bottles will have been left when the engine shut down with a pressure of about 950 to 1,000 pounds, and will have, perhaps, dropped owing to the cooling of the air to about 800 lbs. or perhaps a little less. The operator first of all raises the relief valves of the cylinders by means of a special lever, which action releases the compression in the cylinders, and allows him to bar the engine round to the air start position. This position is, of course, that in which the air start valves on the two inside cylinders will be open for the admission of air. He then closes the relief valves again, and opens the valve from the air bottle. The engine immediately turns over, and the operator, who has previously seen that the fuel tank is full and ready for the day's work, opens the fuel control valve to give fuel to the pump, and closes off the air start valves by means of a control lever, which puts the air start lever into neutral position. This particular engine usually picks up after a couple of revolutions from dead cold. The operator comes in about ten minutes before starting time, looks at his fuel tank, gives a general look around the engine, and starts her up

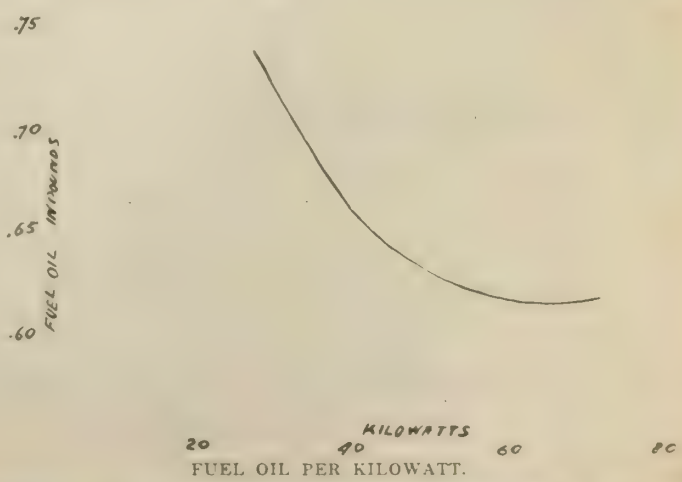
SECTION THROUGH AIR COMPRESSOR.

SECTION THROUGH FUEL PUMP.



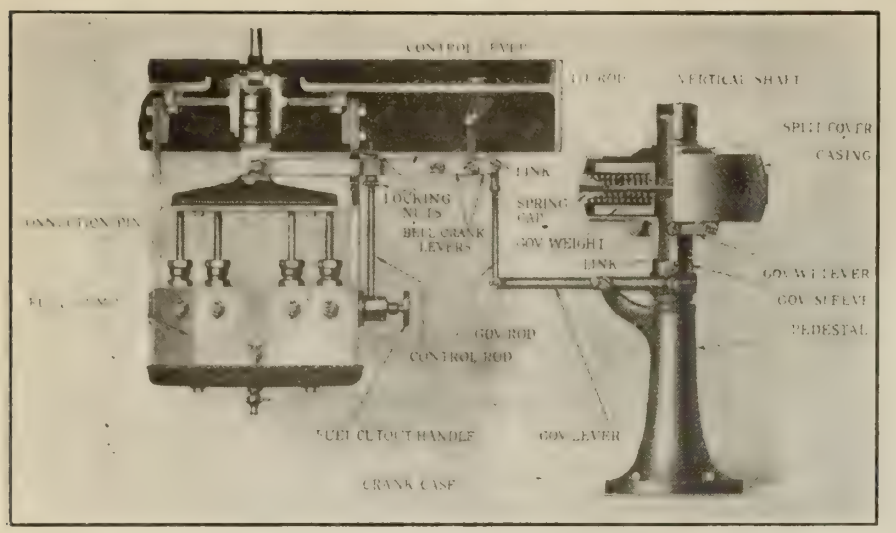
about five minutes to the hour, and is all ready with the current at the switchboard when the shop is ready to start.

Once started, the engine requires practically no attention. The air compressor draws in the air from the atmosphere, passes it over the element containing the air coming from the low pressure stage to the high pressure stage, thus cooling the latter, passes the air through its two stages, the final delivery pressure being from 900 to 1,100 lbs., according to the load being carried. This air is delivered to a chamber on top of the cylinder, and at the proper moment the fuel from the fuel pump is injected into this chamber and the valve from the chamber into the cylinder is opened, and the finely atomised spray of oil fuel injected. Ignition takes place without shock and combustion at practically constant pressure ensues, the gases expanding and driving out the piston. At a point just before the bottom of the working stroke is reached, the exhaust valve is opened, and held open throughout the return stroke discharging the exhaust gases. At about the top of the stroke, the cam closes the exhaust valve, and opens the air suction valve, and the cylinder is filled full of pure air. The valves are then all closed, while compression takes place on the fourth stroke, and at the end of this stroke ignition again occurs.



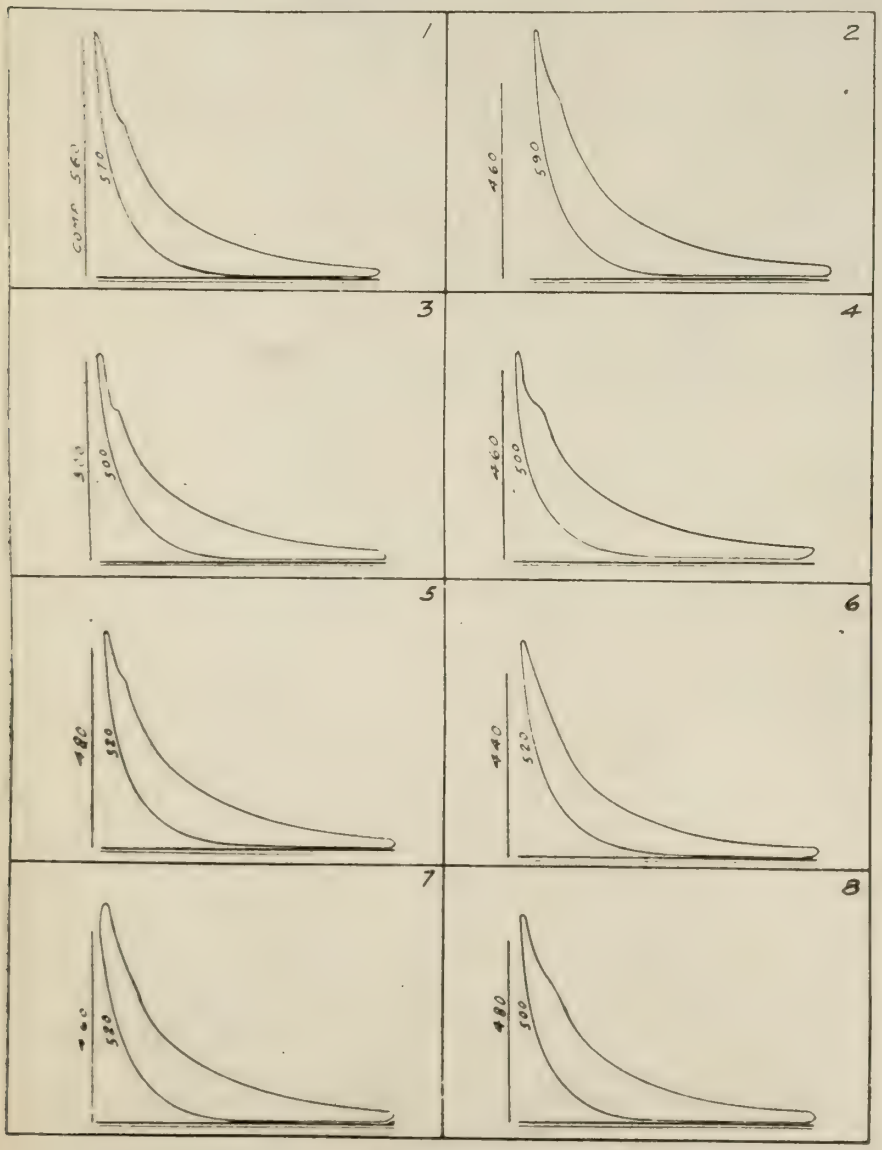
A pump situated in the base of the engine supplies oil under a pressure of ten to fifteen pounds to the crank pin, and through the connecting rod to the wrist pin, while special lubrication is supplied to the piston. The air compressor is lubricated by the oily spray generated in the crank pit by the passing of the cranks through the oil bath, and this is all the lubrication employed for the air compressor.

The accompanying illustration shows the typical indicator cards obtained from this engine, while the section cuts explain very clearly the working parts. Fuel consumption is shown by the curves illustrated here.



A representative of Power House had the opportunity recently of seeing this engine performing its daily task, and was impressed with its splendid performance under somewhat difficult circumstances. This engine was built with an ordinary sized flywheel, to drive a generator on fairly constant load. The work it is doing now is under very considerable variation of load, from no load to a 50 per

FUEL OIL PER BRAKE HORSE POWER.



FUEL OIL PER KILOWATT.

THE GOVERNOR AND CONNECTIONS

cent. momentary overload occurring frequently. The speed regulation under these conditions was excellent, and standing at the exhaust pipe, the only indication of anything unusual was a puff of blue smoke. At ordinary load the exhaust was practically invisible, showing excellent conditions.

The Dominion Steel Products are to be congratulated on being the pioneers in Canada of this type of prime mover, and its development will be watched with interest by the engineering profession in general. Mr. Brown, the designer of the engine, gave a highly interesting lecture on the engine before the Canadian Association of Stationary Engineers recently, which was well attended, and discussed with interest by those present.

TYPICAL INDICATOR CARDS.

**POINTS ON CONSTANT PRESSURE DIESEL ENGINE.**

It can use high compression pressures as it does not compress a mixture.

The mixture is very lean and burns slowly and loss in cooling water is less.

Four gallons of cooling water per B.H.P. ample.

Perfect combustion due to complete atomizing and slow burning.

Oil of high flash point, thus cheap oil can be used.

Typical test data:—

Compression pressure per square inch, 510 lbs.

Mechanical efficiency, 82.5 lbs.

Fuel consumption per B.H.P., .45 lbs.

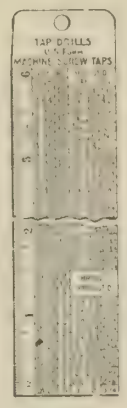
Cooling water Temp.—in, 46 deg. F.

Cooling water Temp.—out, 103 deg. F.

Exhaust gases, temperature, 600 deg. F.

Heat value of fuel, B.T.U., 19,000.

Specific gravity of fuel, B.T.U., 86.5.



## NICKELING ALUMINIUM

A process for nickeling aluminium is described in Annales de Chimie Analytique as follows: The aluminium is immersed for two minutes in a cold solution of ammonia and potassium cyanide. The metal is then well washed and brushed with milk of lime until the surface acquires an even, brilliant white tint. Then the washing and brushing are repeated with water, so as to get rid of all traces of lime, and the metal immersed in an acid bath of manganese, and iron chloride. The metallic coating of iron or manganese which serves as the "mordant," as it were, to fix the nickel to the aluminium, forms upon the aluminium. After two to three minutes' immersion in the acid bath, the metal is rinsed with water and put in the nickeling bath, which consists of nickel sulphate. The anodes are plates of laminated nickel. The electric pressure used should lie between 2.5 and 3 volts, otherwise a non-adherent deposit would be obtained. The current density should be from 1 to 1.5 ampères per square decimetre. The treatment for moderate-sized objects lasts one hour to one hour and a half, and is followed by washing in boiling water and drying by compressed air.

It has been announced that the contract has been let for the erection of a ten-story hotel structure at the corner of London Street and Dougal Avenue, Windsor. Estimated cost $2,188,500.

# Have You Tried This Contest Yet? If not--- Do so Now

Below will be found twelve references to advertisements in this number. To the sender of the first correct set of answers to these we will forward one of these scales.
To win one is not difficult, and at the same time you will add to your store of knowledge. Read the details given below.

The scale is 6 in. long and is made from finest quality steel. One side is marked in 32nds, the other side in 64ths. A table of decimal equivalents is also stamped on one side, and a table of tap drill sizes on the reverse side. This scale is well worth securing.

## What You Have to Do

We publish every week a number of interesting facts or statements selected from the advertising pages for that week. The selections for this issue are given below. Read these through, then turn to the advertising section and see if you can pick out the advertisements to which they refer. The work is interesting, it will train your powers of perception and of memory, it costs you nothing, it will make you better acquainted with the various lines of machinery and tools in the market, and with perseverance you are bound to win one of these useful scales as a prize.

Evidently there was some doubt about question No. 6 in the Feb. 24th issue, for only one reader had it correct. The query was, "A reasonable request." Look on Page 31 of that issue and you'll see the request. Reginald Compton, 321 St. Philip St., St. Henry, Montreal, was the only reader who sent in twelve correct answers, so that the scale goes forward to him. We have had several letters stating that scales have not been received. Should there be any other prize winners who have not receivd their scales, write us at once. We have been posting these scales regularly, but for some reason or other they have been going astray. They are now being sent by registered mail, so we should have no further trouble.

**CONTEST FOR MARCH 17TH ISSUE**

**Contestants are required to write us, stating to which advertisements we refer in this number.**

1—Something that has a swing over the bed of 35". Some swing?
2—A product said to be a profitable producer.
3—Something useful in damp localities.
4—How to solve the problem of economic production.
5—Something that is beyond the experimental stage.
6—A product that cuts and draws in one operation.
7—Some valuable inside information.
8—How to make better workmen.
9—Something noted for their efficiency.
10—How to maintain safety, economy and efficiency.
11—Something that has been made for eleven years and is still giving satisfaction.
12—How to handle special jobs away from the air line.

**These are Correct Answers for List from February 24th Issue:**

1—Canadian Ingersoll-Rand Co.
2—Smooth-On Mfg. Co.
3—Northern Electric Co.
4—Butterfield & Co.
5—Taylor Instrument Co.
6—Gisholt Machine Co.
7—Nicholson File Co.
8—Cleveland Pneumatic Tool Co.
9—Independent Pneumatic Tool Co.
10—Canadian Detroit Twist Drill Co.
11—The Liquid Air Co.
12—Imperial Oil, Ltd.

## Closing Date for This Contest is April 7th.

# DEVELOPMENTS IN SHOP EQUIPMENT

## PATENTED CUTTERS

The Cleveland Cutter & Reamer Co., 1619 Merwin, Ave., Cleveland, Ohio, have placed on the market a line of patented inserted tooth milling cutters as shown in the accompanying illustrations.

The cutter shown at Fig. 1 is known as an inserted tooth side milling cutter and has a machine steel body. The blades are made with a corrugation on the back as shown, and it is claimed that this method eliminates all slipping and tilting, also the packing sometimes used underneath the blades. The blades are said to be so constructed that they can be moved out 50 per cent. farther than various other types with similar results.

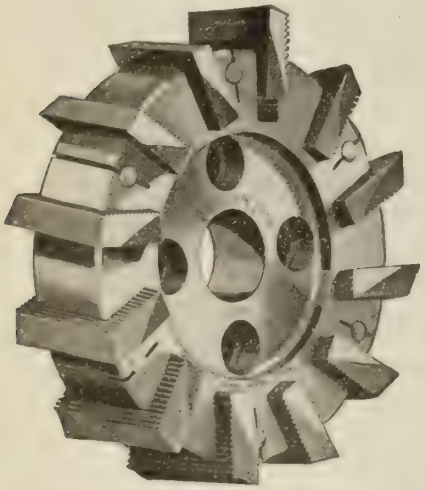


FIG. 1—SIDE MILLING CUTTER.

All blades are interchangeable and can be replaced at small cost.

The face milling cutter shown at Fig. 2 has all the other characteristics of the former styles and is made with both carbon and high speed blades. The blades are set so that they can be easily adjusted when worn. A taper hole, with keyway for driving, is used, but this same style cutter can be made with threaded hole, or to fit milling machine with flanged spindles if so desired.

FIG. 2—FACE MILLING CUTTER.

The third example, Fig. 3, depicts an adjustable reamer that is said to be the only reamer that has a double adjustment. Screwing back the lock nuts in back of the blades 5-16 of an inch will give .083 inch adjustment. Placing the blades up one step in the corrugation will give another .083 inch of adjustment. This procedure can be continued until the blades are worn out. The reamers are made with blades set in the body straight as shown, but spiral set blades are made when ordered. They can also be equipped with a float if desired. All sizes from 1 inch to 6 inches, or even over if on special order, can be furnished. The first type of cutter is made in sizes ranging from 6 to 12 inches, while Fig. 2 is made from 5½ inches to 9½ inches. It is, of course, understood that other sizes can be made if desired.

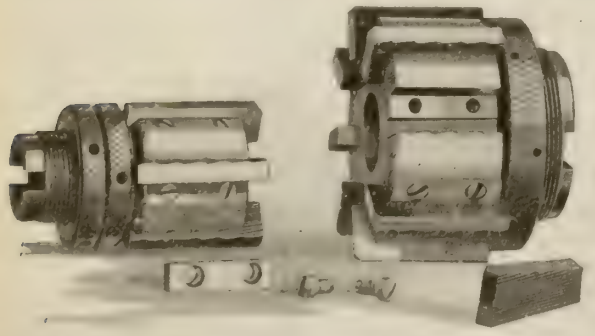
## POWER MOWER

The Aikenhead Hardware, Ltd., Temperance St., Toronto, Canada, are now Canadian distributors for the Ideal Power Lawn Mower Co. It might be well to add that these mowers are said to be a new departure, in so much that they are very simple in mechanism, and complete control is effected by two levers. One lever governs the power unit, the other raises or lowers the cutting unit. These mowers are made in various styles, but the type shown in illustration is a hand operated model. When the acreage is large enough, the tractor type is used, these of course cutting a larger swath.

The cutter on this mower is not driven direct from the engine, but the cutting reel is driven by the traction of the mower wheels. The mower is freely suspended from the frame by two side arms, these allowing sufficient play to permit a free tilting motion of the cutter. The wheels, of course, readily adapt themselves to any irregularity of the ground surface. This, of course, eliminates breakages when obstacles are met with.

The engine is the design of R. E. Olds, whose Oldsmobile car is already a well-known type. It is of the air cooled type and is mounted in such a way as to give the least possible vibration. Canadian Machinery saw several letters written by users stating their satisfaction with these machines, and it is hoped to interest all cemeteries, golf clubs, city park authorities, private estate owners, in fact any person having considerable acreage to cut. A list was supplied us stating a number of Canadian users at the present time.

The standard machine shown cuts a swath 30 inches wide and has a speed of 2¾ miles per hour.



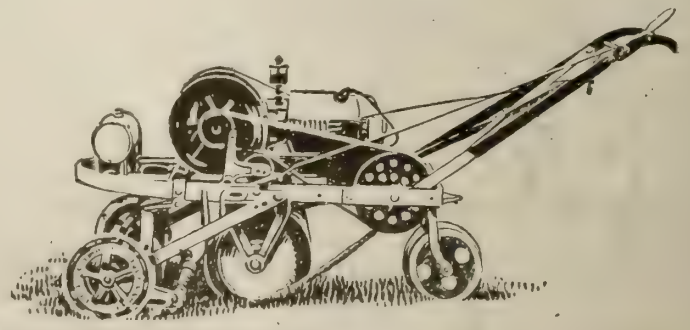


FIG. 3—SHOWING THE ADJUSTABLE TYPE OF REAMER.

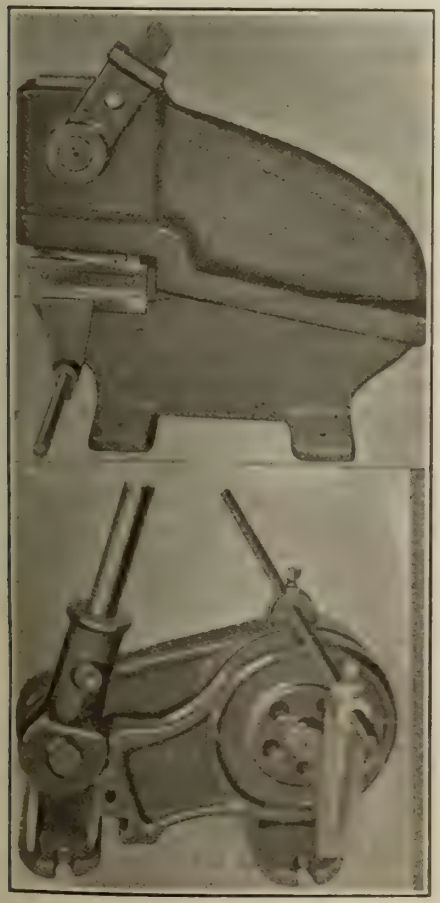

AN OUTLINE VIEW OF THE POWER MOWER.

### TWO NEW MACHINES

The Brantford Machine Tool Co., Brantford, Ont., have placed on the market two new machines, both of which are illustrated herewith. Let us first consider the shear. As will be noted this machine is of rugged construction and is made from the best of materials. It has ample leverage for the work it is intended to perform, and the shear is operated from the front. The frame is offset so that the metal will not bend in cutting sheets of any length or width.

The shear blades are reversible, so that the four edges can be used without regrinding. They are also adjustable. The machine is also equipped with a guide stop, and the hold down on the other side is adjustable to thickness, and is reversible, this allowing it to get close to the blade. Such a shear is claimed to be particularly useful in machine shops, sheet iron works, warehouses, tin shops, blacksmith shops, etc. The capacity is quarter plate, the bottom blade 7 inches long, the top one 6 inches, and the weight 240 lbs. Legs are supplied if necessary.

The rod cutter as shown in the other illustration has a capacity up to ⅝-inch diameter. The cutter blades are made of the best grade of steel, properly tempered. These blades are adjustable and may be ground when dull. A stop can be set to cut any number of pieces the same length, and this machine can be used in any shops using rods or wire.

VIEWS SHOWING THE SHEAR AND ROD CUTTER.

# NEW THINGS IN MACHINE TOOLS

### FLEXIBLE-SHAFT MACHINE

The R. G. Haskins Company, of Chicago, Ill., has recently made some improvements to their flexible-shaft grinding machines for die-sinking. By means of a swivel base the machine can be rotated through a complete circle. This feature, in addition to a special leaf spring support at the motor end of the shaft, assists in eliminating unnecessary bending of the shaft. Trouble is generally developed at the inner end of the shaft, where it connects with the motor shaft, and the added protection prolongs its life.

### GRINDING AND BUFFING MACHINE

In the combination grinding and buffing machine brought out by the Cincinnati Electric Tool Company, provision is made for the alternate grinding and buffing of the work without the removal of the wheels, these being fitted to opposite ends of the spindle. The driving motor forms the body of the machine and the motor windings are fully enclosed. Annular ball bearings are fitted to both ends of the armature spindle and also at the extreme end of the extension spindle. All bearings are amply protected from flying dust. The machine can be obtained either with or without the floor stand.

### DIE-FILING MACHINE

A new line of die-filing machines, especially adapted for work of a heavy character, has been placed on the market by W. D. Rearwin, of 716 Monroe Ave., Grand Rapids, Mich. The machine is adjustable to a maximum stroke of 7 inches. The table has a surface of 20 by 24 inches and is located 30 inches from the floor. Arms are fitted to the machine for carrying hack saws and heavy sawing can be performed. Filing can be accomplished where the bottom of the work has a shoulder or is closed entirely. The machine can be obtained either for belt drive or fitted with an individual motor. The weight of the machine is about 650 lbs.

### NEW STYLE TOOLHOLDER

The Brooke Tool Manufacturing Company, of Birmingham, England, are now making a new tool holder that does not require a set screw for the holding of the small tool bits. The tool-post screw serves the two functions of securing the holder and gripping the tool bit. The holder is self-contained and is so designed that either end may be placed through the tool post. The tool holder is made in two pieces, the clamping portion being retained in position by means of a small pin at the forward end. The tool is made in three sizes.

## The Uncertain Steel Market

THE steel market is not in a healthy state, either in Canada or United States, and no good purpose is to be served by claiming anything to the contrary.

The reason is not hard to find—it is, as a matter of fact, lying right on the surface. Neither the buyers, the steel merchants or the steel makers have any confidence in the present situation, particularly in the present price schedule.

We are right in the middle of a sagging market. A careful scrutiny of the markets week after week generally brings to the surface some item that has been more or less whittled and hacked at in order to bring a purchaser to the point where he will place his business.

The steel merchant who wants to liquidate has a peculiar position in the present non-buying market. Even if he is prepared to cut his prices in order to clear out his high-cost material, regardless of whether he breaks even or takes his loss, he has to face the condition of only hand-to-mouth business coming into the market. In plain English, although he wants to liquidate, he can't do it.

One can go over almost the whole run of the iron, steel and metal market to-day, and he will find that there is a feeling of uncertainty as to whether the bottom of the market has been reached. Whether that is really the reason for the attitude of the buyers is open to doubt. Were they in need of iron or steel they would buy and make the best of the price.

The United States Steel Corporation, by adherence to its schedule, has done more than any other agency to keep the steel market both in United States and Canada from running away and losing itself entirely. It has yet to be shown that the raids of the price-cutters have brought an extra ton of business to the books of any of the mills.

## Canada's Iron Ore Again

THE Dominion Government spent a couple of hours the other day listening to addresses telling the members how Canada should go ahead and develop her natural resources, make use of her native iron ores, pay bounties for the production of iron ore, pig iron, etc.

There is nothing particularly new in the idea—in fact, it is old and nothing was added to the sum total of what has been said before by the debates at Ottawa this week.

The trouble with this matter is that those who bring it up from time to time have nothing concrete and definite to offer. It is all very well to carry along agitations in certain directions, but unless something tangible is brought out, the agitation will totter and fall from its own weight.

The work of research requires a tremendous amount of patience and persistence, and the Research Council has done splendid work in its first stages. It must be prepared right from the start to go up against popular indifference because the majority of the people in this and any other country are very fond of working along the lines of least resistance, and that is one of the reasons why we are bringing iron ore to our blast furnaces from United States instead of using our own.

The fact that Canadian furnaces and steel mills have to compete with United States mills makes it commercially necessary for them to obtain their raw materials at the point where they can be secured with the greatest degree of commercial advantage. In doing this they have had to ignore Canadian iron ore to a large extent because it would not be possible to treat it and make it fit for use, and then sell the finished product in competition with Buffalo or Pittsburgh.

Let the Government provide facilities and money for experimenters with various processes for treating our refractory iron ores. It takes a great deal of money to carry on this work properly, and few men can afford to do it. For the present the big work of the Government should be toward perfecting a commercial method of using iron ore rather than tossing out temporary sops in the way of bonuses for a tonnage of Canadian ore used or pig iron produced. Once the method is perfected and shown to be workable on a commercial basis, the other matters will take care of themselves.

## The Condition of Germany

ON another page Canadian Machinery presents the opinions of several Canadian manufacturers regarding the matter of dealing with Germany. Canadian mails are carrying an increasingly large volume of catalogues and sales literature from Germany, and there is a persistent and well-organized effort being made to push German goods in the markets of the world.

One fairly keen student of German conditions has been looking over the pages of some of the German engineering papers, and in one copy of the *Zeitschrift*, of the German Society of Engineers, has found over thirteen pages of advertisements seeking engineering help. Less than a page is occupied with the ads. of those seeking positions.

Among the advertisers are such well-known firms as the General Electric Co. of Germany, Fried. Krupp, Gutehoffnungshütte, Brown, Boveri & Co. (Mannheim branch), the Deutz gas engine works near Cologne, Ehrhardt & Sehmer at Saarbrucken (now, of course, in French control), the Humboldt Works near Cologne and numbers of foundries. The Gasmoteren-Fabrik Deutz includes in its advertisement the request for an engineering representative in Mexico and engineers for the export department.

The whole thing goes to show that there is no special call for this, or any other country, to spill over with sympathy for the bleeding-to-death industrial Germany.

# MARKET DEVELOPMENTS

## The Markets All Over Lacking Stability

### Buyers Are Not Coming in Yet and so it is Hard to Carry on the Programme of Liquidation—New York Has Only a Few Inquiries, While Steel Mills Are Running Low

A SURVEY of the leading markets for the week shows that machine tools, iron, steel and metals are quiet and weaker in price. Just to what extent the price has weakened is impossible to state because in several instances the word "price" indicates now what the buyer thinks he should pay rather than what the seller is asking.

Machine tool sales are limited to single orders, and large installations are not being made. Many factories have taken advantage of the quiet season to go over their mechanical equipment and put in improvements to existing equipment, but this has only led to small buying. Some price shading is reported in the sale of small tools, such as taps, dies, reamers, cutters, drills, etc.

The steel market is in a peculiar position. Warehouses have for some weeks been making an effort to liquidate their stocks to as great an extent as possible, and in an effort to do this, existing selling schedules have not been allowed to stand in the way. It is a difficult matter to liquidate when the buyer is not coming into the market, and as a result progress in this direction has been rather slow. Shipments into this territory from the mills of the U.S. Steel Corporation have been large during the week, and most of this material goes direct to the manufacturers of Canada, and not to the warehouses of the steel merchants. The Corporation has given no sign of any intention to meet the price-cutting practice of the independents.

The scrap metal market remains in a bad way, and a number of the smaller dealers are able to stay in the business only because of their ability to reduce their overhead, and wait until things turn for the better. None of the yards are making money now, and the pressure on some of the less fortunate ones must be getting rather severe.

## MONTREAL AGAIN WONDERING WHAT WILL HAPPEN WHEN MAY 1 COMES

Special to CANADIAN MACHINERY.

MONTREAL, March 17.—The agitation now on for an adjustment in the rate of wages paid to railroad employees may result in a settlement that will have a far-reaching effect upon industrial activity. It is possible that some concerted effort on the part of labor may be made to prevent any serious cut in wages, but even among certain classes of labor there is a feeling that some satisfactory arrangement must be made before a general return to industrial activity can take place. However, many are looking forward to May Day with feelings of nervousness, uncertain as to what attitude labor will assume regarding universal reductions. The situation in this district does not carry that degree of tension so marked in other places, but there is always that undertone of restlessness which is more or less evident at this period of the year, and this year a little more emphasized than in the past. The likelihood of the early opening of navigation has relieved the pressure somewhat, as the Montreal Harbor Board is making preparations for early activity; this will gradually absorb many of the unemployed in this district.

**Steel Situation a Problem**

The many problems involved in working out a solution to the existing steel problem makes the answer a very uncertain one, and the seeming elimination of one factor only brings out another in a different form, so that the final equation, though slightly changed, still contains that unknown quantity—uncertainty. As outlined by one dealer here the question is one of labor and transportation. "The prices quoted by many independent mills," it was stated, "represent figures at which it is virtually impossible to manufacture the material at the present time. This cutting into prices has not stimulated buying to any extent, and it is a question whether many of these mills could accept much business at prices now quoted. There is the possibility that it is an effort to get the U. S. Steel Corporation to make a definite move at price and wage adjustment, but if this is the reason, the move so far has not succeeded, for the Corporation continues to quote the old figures and to pay the high rate of wages of busier times. These wages, in many instances, show an increase of 150 per cent. over those of 1915, and freight charges are fully 100 per cent. above the pre-war rates. For the larger interests, handling every detail of production, from smelting the ore to turning out the finished product, it might be possible to maintain a fairly high wage scale and yet reduce selling prices, but in the case of the smaller mills the haulage charges are items of expense that influence the final selling price." The buying locally shows little or no improvement and dealers are generally optimistic in tone but not in fact. The cheerful outlook of most dealers is for some indefinite period ahead and not for the immediate future. One steel merchant here remarked that a slight betterment was noted in last week's total, but had nothing to say as to steady improvement. "One thing is certain," was one remark made, "and that is, that to get business you have to go after it. Buyers today are only taking what they need today. If they think they will require some article next week, they will wait until next week to buy it."

**What Does the Future Hold?**

Movement of machine tools and shop equipment is of a quiet character. Buying is confined to single tools or small

quantities of supplies. Manufacturers' needs are few and wherever possible they try to manage with what they have on hand. Running at part capacity, as many of them are doing, they have the advantage of utilizing equipment which under normal conditions would not be available, so that the necessity for spare or stock supplies is not so essential. The remark of one dealer was to the effect that he "would not be surprised to see this dull period extend throughout the entire year," but he also stated that his past week's sales showed a slight increase over previous weeks. The future seems to be anyone's guess, but even if the average "guess" is realized, business may be expected to show improvement before the summer months.

### Prices Do Not Effect Sales

Little encouragement has been given to old material dealers by the trend of business during the past week. The situation is much the same as it has been since the beginning of the year, the movement being restricted to purchases sufficient only to tide them over the immediate period, and the volume required for this purpose is relatively light when compared with normal times. Dealers here are getting a little nervous at the extended period of dullness. In the opinion of dealers, consumers would find this a good time to buy, as the former state that prices cannot go much lower. However, demand from users of scrap does not reflect this attitude of the dealer, so that activity in old materials must remain as it is until the reaction of present dullness takes place. "It does not matter much what price is quoted, as buyers apparently are not interested. Those quoted are nominally correct, but we regulate the price for each sale transacted." This remark by a dealer reflects the listless condition of the market and trading will probably continue quiet for a month or six weeks.

## KEEN SELLING IN SEVERAL LINES

### Business Going to Those Keenest to Get It, and Price Quite a Consideration

TORONTO.—February showed an improvement over January in nearly all lines of business in this district, and in a good many this improvement is being maintained in March. From this it is not to be concluded hurriedly that business is quickly on the up-grade, or anything approaching it, but there is a better showing in several places, and in no place that Canadian Machinery inquired was there any retrograde movement.

Machine tool houses are not getting any large orders. There are some machines going out, and there is quite a list of inquiries in the market, in fact this list is growing to very fair proportions. One dealer recently was preparing a number of propositions to be sent out on prospects that he was definitely sure would come into the market within a reasonable length of time.

Firms handling used machinery are having a fair demand for odd pieces of equipment, and one house reports the sale of quite a number of chucks, chain blocks, etc.

It is safe to say that the whole territory is being more thoroughly worked than for some time past. As stated in previous reports, the buying that is being done is all more or less small.

### Number of Small Orders

Small tools are being bought sparingly, and there is particularly keen competition. As is generally the case when competition gets very keen, there are plenty of rumors in the market of prices that have been shaved when it looked as though business were going to slip by if strict adherence to a price were insisted upon. "It is hard to say where this is being done," remarked one dealer, "but there is a very clear feeling in the trade that there is quite a bit of it going on just now. No one claims that it brings out any more business, and it all works out to the advantage of the buyer. Of course it is a buyer's market just now, and the latter is taking advantage of it."

Then there are a number of resales of small tools being made in this district. Firms bought some months ago rather heavily, feeling that in order to keep their plants running they should have a good stock of all sizes, and they also feared that they might not be able to get them readily were the demand to keep up as it was at that time. This material was taken in at a figure quite a little higher than that prevailing now. So when they get a chance to unload any of their material they are ready to do so. In this way they are turning a certain amount of their stock into cash, even if they have to accept a loss when present selling prices are put over against the price at which they bought in the first place.

Another report has it that one railroad order of fairly large dimensions brought down a figure that was considerably lower than anything that has been named for some time. These reports of price shading must not be taken to indicate that they are the general practice of the market. Prices have not been officially altered for some months, and the great bulk of business is being done at these figures.

### Steel Market Quiet

The improvement which seemed apparent in the steel business a couple of weeks ago is not being particularly well maintained, and business is quiet this week.

"We have been making an effort to liquidate our stock," remarked one merchant recently. "We believe that it is the right and proper thing to do, and we are making an honest attempt to do it, but will you tell me this, how are we going to liquidate when people are not buying? All the yards around here have the same idea just now. They want to get rid of their stocks, and are willing to meet the buyer half way in order to do it. What happens? Every little order that comes along now is peddled around until it can't walk any farther. Then it is taken in at a price, and one yard only gets a chance to make the sale and reduce stock to that extent. If some one will come along and tell us how to liquidate when there is very little buying being done, they will settle for

## POINTS IN WEEK'S MARKETING NOTES

**Production at the steel mills remains at about the same rate as last week. Unfilled tonnage continues to recede, and business booked is not keeping up with production.**

**It seems to be fairly well established that $25 is going to be the recognized price for pig iron in most of the leading points in the United States.**

**Canadian steel mills are not running more than half capacity. One furnace is likely to keep on making pig iron and stacking it.**

**Machine tool builders in Canada are not getting much business at present. The buying of the Canadian railroads, counted upon some time ago, to help out, has been rather small all through.**

**Scrap metal prices are simply nominal, and the volume of business being done continues very small. There is nothing in sight to indicate that better times are coming soon for this business.**

**Some pretty keen selling is being done in the small tool business, and some of the dealers claim that prices are going by the board in several cases in order to land orders.**

**Only a limited inquiry has come to the New York machine tool markets lately, and business continues dull there.**

**A number of Canadian machine tool dealers report that they have more inquiries on hand now than for some time past, and most of them represent legitimate prospects.**

us the biggest problem we have to face just now."

Competition is very keen for anything that shows up. Buffalo warehouses are after anything they can get from the power development in the Niagara district, offering in many cases to meet and go one better on any price offered by the home firms.

Mills are looking for business harder than for some time past. In many cases it would seem that the mills are competing with the warehouses, as they are taking in orders of a size that were formerly regarded as the property of the warehouses, and so small that the mills did not consider them worth while.

There is a fair business going in tubes. Since the first of the year about 75 per cent. of the business done in this line has been for marine work, and there has been very little coming in from industrial plants. According to seasons there should be orders arriving now for industrial plants. Then there are construction firms that must get their equipment —especially that used in field work—in shape for the season. There are some orders going through for reinforcing material. Contracts for buildings are slow in being closed, and some hold that the amount of floor space available in the city now for industrial purposes is making it unnecessary for other firms to build, although it is also a fact, according to real estate men, that these vacant places are being held at a good figure, showing little, if any, recession from last year's high figures.

### Prices Are the Same

There is nothing to indicate that the steel market, in spite of the keenness for business, is out of hand, or that it is running away. The attitude of the Steel Corporation is still the controlling factor in the situation, and they have so far stood pat on their schedule. Canadian mills are not well employed at present, some of them not operating at half their capacity. Some of the furnaces, it is understood, are still operating without many orders, it being the intention to go ahead and stack a certain amount of pig iron against the time when business conditions shall improve. The price of $39.25 remains as the quotation for No. 1 foundry.

### The Scrap Metal Market

There is nothing better for the scrap metal trade this week, and they are simply marking time, and hoping for a better break soon. Some of the smaller men in the business are being badly pinched just now. Present prices are so low that it hardly pays them to keep operating on any scale. The larger dealers to whom they are accustomed to sell are not taking on stock. The fact that they can get down to little or nothing in the way of overhead expenses is helping to keep a number of the little fellows alive in the scrap metal business.

# NO INDICATION THAT CORPORATION IS GOING TO BREAK FROM ITS PRICES

Special to CANADIAN MACHINERY.

PITTSBURGH, March 17.—There is a distinct, though small, increase in the volume of buying of some steel commodities, this improvement being most marked in the case of sheets. The improvement was predicted at the beginning of the year, being based chiefly on the progress of the season, as demand always becomes more active on the approach of spring. In January, however, a greater improvement was expected than now seems likely to develop.

Improvement, however, does not make the steel market active by any means, since it was entirely stagnant. The increased buying is in miscellaneous quarters, there being no large projects. Some of the business received, and counting as part of the improved demand, is in the form of releases to shipments formerly suspended. The strictly new buying is still conspicuously light, though not altogether as light as two or three weeks ago.

### Production

The process continues of old orders running out, and accordingly the increase in buying and the releases against suspensions are not sufficient to arrest the decline in actual production. The monthly report of the American Iron and Steel Institute, giving the steel ingot output of the thirty steel companies that make monthly reports, indicates that steel ingot production during February was at the rate of about 25,150,000 gross tons a year. The Steel Corporation produced at 76 per cent. of its capacity and the independents at 26 or 27 per cent. of their capacity, making a total for the industry as a whole of about 48 per cent. The percentage is not nearly as bad as it seems, for it does not mean 48 per cent. of any actual production that has been realized. The steel industry has not been able to operate at capacity since 1916, there being either shortage of orders or physical difficulties. In the first nine months of 1920, when steel was scarce, the average operation was only about 80 per cent.

Production at the present time is lower than the average rate of February, being approximately at the rate of 21,000,000 tons a year, or just one-half the rate during the first nine months of last year. Considering how active the demand then seemed to be, and how completely absent demand now seems to be, this really looks like a high rate. Although the independents started cutting prices early in February while the Steel Corporation has maintained its prices, the production rates now are about 13,500,000 tons by the corporation and 7,500,000 tons by the independents, so that the corporation is making about 65 per cent. of the steel although it has only about 43 per cent. of the capacity.

### Steel Corporation Orders

The Steel Corporation's unfilled obligations decreased during February by 639,297 tons, against decreases of 574,958 tons in January, 873,359 tons in December and 815,371 tons in November. The February decrease represented 51 per cent. of the month's capacity, and as shipments may be estimated at 75 per cent. of capacity the net bookings in the month appear to have been about 24 per cent. of capacity. The net bookings are, of course, the total bookings minus cancellations, of which there were few in February or January. In November and December there was a very considerable quantity of cancellations, some of the cancelling being by initiative of the corporation of orders that seemed unlikely to represent actual shipments within a reasonable time. That the Steel Corporation should book any business at all when the independents were cutting prices shows that the corporation's customers are quite willing to stay with it, expecting they will profit in the long run, as in the past, by doing so.

### Prices

Bars, shapes and plates are quotable at the same prices as a week or two ago, 2c for bars and 2.10c for plates or shapes. Generally a very ordinary sized order can be placed at these prices, but the specifications have to be fairly attractive. Plates and shapes are no stronger than a week or two ago, but bars are apparently a shade stronger, since an extreme concession from the 2c price would be $1 or $2 a ton, for a very attractive order, while three or four weeks ago it appeared that 1.85c could probably be done on a large order.

Sheets, on the other hand, are easier. Ten days ago the market on fair-sized lots with reasonably definite specifications was about 3.20c for blue annealed, 4.10c for black and 5.20c or 5.25c for galvanized. Now it is possible to do 3c, 4c and 5c respectively, and in some quarters it is believed that the 4c price on black could be shaded. The spread between black and galvanized is narrowed down to about $1 per 100 pounds, when the Industrial Board spread was $1.35. The decrease is attributable largely to the low price of zinc, which is 4.80c, St. Louis, or lower than the average price in any calendar year since 1902 with the exception of 1908.

Tin plate remains at the old price of $7 per base box, 100-pound, all efforts of buyers to break the market having failed. The mills hold together because they realize that if any accident should happen to the regular price there would probably be a decline that would prevent the mills from realizing cost out of their high-priced tin bought before

the decline to the present remarkably low price and might make them experience a loss beyond that.

Standard steel pipe also remains at the old price, the market still being quotable at a basing discount of 57½ per cent. Demand has held up better for pipe than for any other finished steel commodity, although by this time even pipe demand is rather light. There is shading on some other descriptions of tubular goods, particularly on line pipe.

### Pig Iron

Another 50-cent decline is recorded in the foundry pig iron market, as the Standard Sanitary Manufacturing Company has bought 1,000 tons of valley foundry iron on the basis of $26, furnace, for its New Brighton plant, near Pittsburgh. At the same time this interest bought 1,000 tons for its plant at Louisville, Ky., taking half from Virginia furnaces at $26, furnace, and half from Birmingham furnaces at $25, furnace, the last named price being $1 under the Birmingham market as previously quoted.

Basic iron remains nominally quotable at $25, valley, and Bessemer at $27. These are quotations of merchant furnaces. It is thought probable that some steel works would sell from their surplus stocks of basic at about $23. A careful canvass of the situation made by a producer shows that just now there is no real price issue as between producer and consumers, the consumers stating that they have no inclination to buy. Some have no orders against which they could use iron, while others have a few orders but have considerable tonnage of pig iron due them on old purchases, some of this iron being at as high as $40. A 500-ton lot of basic iron has just been sold by a broker at approximately $23, valley, but such a sale would not be representative of the market.

## FEW REDUCTIONS MADE IN NEW YORK

**But for the Most Part the Makers Are Taking No Action in Price Reduction**

Special to CANADIAN MACHINERY.

NEW YORK, March 17.—While the machine-tool markets are still dull, there is a trifle more life to some of the inquiries now being received. The principal inquiry before the trade is that of the American Sugar Refining Company, New York, which will buy about fifty tools for its maintenance shop at the Baltimore, Md., refinery. The New York Central Railroad is in the market for four large tools and the Virginian Railroad is inquiring for ten or twelve tools. The Santa Fe Railroad, which recently purchased about $125,000 worth of machine tools for its shops at Albuquerque, New Mexico, is now in the market for four cranes, including one of 250 tons capacity.

### A Few Reductions

A few price reductions have been reported within the past two weeks, but the majority of leading manufacturers are taking no action toward reducing prices, believing that reductions at this time would not stimulate buying. The general opinion in the trade is that no activity of importance in the machine-tool trade may be expected within the next two or three months; hence the trade is simply marking time until business conditions have improved sufficiently to bring buyers back into the market in sufficient numbers to insure at least a moderate amount of buying.

Railroads are expected to come into the market some time this year, but it is known that there will be little buying until the roads are in better financial condition. One step in that direction is the reduction in wages now going on. Some of the roads haven't enough money to pay their bills, and when payments are received from the Government under the terms of the Winslow Bill, recently passed by Congress, it will go out mostly in liquidation of debts which have been on the books for periods ranging from a few months to a year. Just as credit and transportation brought about the crisis less than a year ago, so to-day the situation as to credit and transportation must show considerable improvement before there can be stable business conditions again.

## Pig Iron Market

Pig iron prices have again receded whenever tested, and Southern iron is down to a basis of $25, or $1.50 lower than the prevailing quotation of the preceding week. Some furnaces unable to obtain shipping orders on iron sold some time ago are willing to sell additional tonnages at low prices in the hope of speeding up deliveries on old orders and striking a fair average price on new and old business.

On the Pittsburg market one company recently closed for about 2,000 tons of foundry iron, for its plants at New Brighton, Pa., and Louisville, Ky., about 1,000 tons going to each plant. This is the only important business which has taken place during the week and is important because it brings out lower prices than have recently prevailed. The iron for delivery immediately was placed at $26, valley furnace.

The condition of the Chicago market is unstable to a marked degree. A sale of 200 tons of No. 2 foundry was closed last week at $27, Chicago furnace, while early this week a carload of No. 1 material changed hands at $26, Chicago, or the equivalent of $24.75 for No. 2 foundry.

An inquiry on the New York market for 500 tons of No. 2 plain pig iron for prompt delivery brought keen competition among a number of buyers, and the business was placed by a large machinery company at $26, delivered, or $24.46 furnace.

The Cleveland market shows a little improvement in the demand for prompt shipment foundry iron from consumers who have no iron coming under contracts, and who are buying in small lots as needed. These orders are mostly for car lots. Prices have declined and No. 2 foundry is now freely quoted at $26 by a valley furnace.

Philadelphia reports a sale of 500 tons of No. 2 plain by an Eastern furnace at $24.50 furnace, or $26.04, delivered to a plant at Phillipsburg, N.J. Special considerations were involved in this sale. Otherwise the foundry iron market may be quoted at $26 for No. 2 plain and $27 for No. 2X, f.o.b. furnace, these prices ruling on nearly all of the transactions of the past week.

## Scrap Metal Market

The tendency of the scrap market is still downward and consumers are remaining out of the market. On the Chicago market railroads are offering fairly large lots on which they are receiving extremely low bids, but their present need of money is causing them to accept these prices. The scrap is going into yards and dealers figure they can obtain a profit by holding it.

Prices on many grades at Boston are only nominal, as transactions have been so few during the past two weeks.

Philadelphia market shows a slightly improved market as regards buying, but of a hand-to-mouth character. The total was comparatively small, and production of scrap continues greater than consumption, despite the belief that was prevalent among dealers that prices were at the bottom.

Speculators on the Buffalo market who purchased scrap freely a short time ago are facing a loss, due to the further weakening of the market and a new bottom to prices. A local mill is picking up a few choice shipments of No. 1 heavy melting steel at $13.50. Dealers are not anxious to sell, but some tonnages are available.

Buying is at a standstill at Cleveland, in the scrap metal grades, and the only movement of material is on old contracts and in limited tonnage. Prices are unchanged, but indications point to lower quotations.

The Southern scrap iron and steel market is still inactive. A slightly encouraging feature is that the rolling mill at East Birmingham has been getting in orders for bar iron. The plant operates almost entirely on old material. Consumers of heavy melting steel are out of the market, and other melters are buying sparingly.

## Do Your Castings Cost Too Much?

A rearrangement of your patterns might cut their cost 25 per cent.; a different method of molding them might double your production at no increase in molding cost. We can advise you and we have expert metal and wood patternmakers who are able to make any changes that may commend themselves to you.

### If you need some new Patterns

send us a sample, blueprint or sketch, and ask for our advice. It won't cost you anything. If our advice is good and commends itself to you, it is only fair to assume that our work will be equally satisfactory, and we need the work as badly as you need the patterns.

We are in a position to do turning, boring, drilling or other semi-finishing operations on castings supplied by us. **Ask us.**

***We have for our and your requirements, a large stock of assorted White Iron Stars, suitable for light agricultural to medium weight machinery castings, while they last, at 8 cents per lb. F. O. B. Galt.***

## THE GREAT POPULARITY OF GEOMETRIC SCREW CUTTING TOOLS HAS BROUGHT THEM TO US

Thousands of Screw Machine users have come to know The Geometric Tool Company through the perfect work performed by the Geometric Automatic Adjustable Die Heads and Collapsing Taps.

**Connecticut Section of the A.S.M.E., Guests at the Works of The Geometric Tool Company**

A demonstration of the efficiency of Geometric Tools was made. You can make a like demonstration right in your own shop. Let screw thread cutting be the most satisfactory operation there.

## NEW SHOPS, TENDERS AND CONTRACTS PERSONAL AND TRADE NOTES

## Engineering

A sash and door factory will be built by the Lord Bros. at St. Norbert, Man.

A garage and workshop are being planned by Thomas McNeil, Tyron, P.E.I.

Plans are being prepared for a workshop costing $60,000 for the city of Ottawa. Tenders will be called shortly.

The Winnipeg Supply & Fuel Company, 405 Canada Building, are planning the erection of a warehouse at cost or $60,000.

The Gove Motor Car Company, Tilbury, Ont., are contemplating construcethe erection of a warehouse at cost of $50,000.

Work will be started in the near future on the erection of a foundry for the National Castings, Limited, Belleville, Ont.

A direct street car line to link up the southern sections of Windsor, Walkerville and Ford with main service is suggested.

An athletic stadium is to be erected on the corner of King Edward Avenue and York Street, Ottawa, at a cost of $350,000.

The Southern Ontario Gas Company have announced recently that they are planning to erect a large artificial gas plant at Dutton, Ont.

A warehouse is contemplated at a cost of $5,000 by Chas. Fitzpatrick, of St. Louis Grain & Feed Company, 2105 St. Lawrence Boulevard, Montreal, Que.

A permit has been issued for a building on St. Joseph Street, Quebec city, to be occupied by the Woolworth Company's stores, at a cost of $125,000.

The McIlroy Belting & Hose Company, Hammond, Ind., are opening up a branch office at Kingsville, Ont., and will instal equipment to cost about $20,000.

Construction of the $75,000 garage and repair shop for the Consolidated Motors Company, Toronto, will be commenced about April 1. Thomas Sharpe has the contract.

Bremner Norris, 65 McGill College Avenue, Montreal, has been awarded the contract for alterations and addition to factory costing $20,000 for Arlington Company of Canada, Limited, 120 St. James Street.

## WILL DOUBLE PLANT CAPACITY

**Smiths Falls Concern Has Had Substantial Growth and Plans for More Capacity**

Smiths Falls.—The recent re-incorporation of the Smiths Falls Malleable Castings, Limited, the second oldest malleable castings concern in Canada, is in line with a proposed broadening out policy and programme of expansion.

The company was started in 1878 by Wm. H. Frost and Chas. Jones with a capital of $2,500. Six years later the latter partner sold his interests to Mr. Frost, who with J. Edwin Frost, the present secretary and director, carried on under the name of the Smiths Falls Malleable Iron Works until 1902, when the Smiths Falls Malleable Castings Company was incorporated.

The business had grown from a mere infant with a cupola and a one-ton annealing oven to two plants covering the better part of two acres with an annual capacity of 8,000 tons and employing 250 men.

In 1906 the Rideau Malleable & Foundry Company, Limited, was organized by local citizens of the north end of the town and when the slump and business depression of 1907 came on, this plant was absorbed by the Smiths Falls Malleable Castings Company, Limited, thereby increasing the capacity by 3,000 tons annually.

Since the original incorporation in 1903 the company has operated on a capital of $150,000, but with the rising cost of manufacture it was found inadequate and also since they suffered the loss of three of their active firm members, viz., Wm. H. Frost and his two sons, Burton H. and E. Theodore, they felt the necessity of a reorganization and therefore incorporated a new company now known as Smiths Falls Malleable Castings, Limited, with an authorized capital of $750,000, which company bought out assets, goodwill, etc., of the old company.

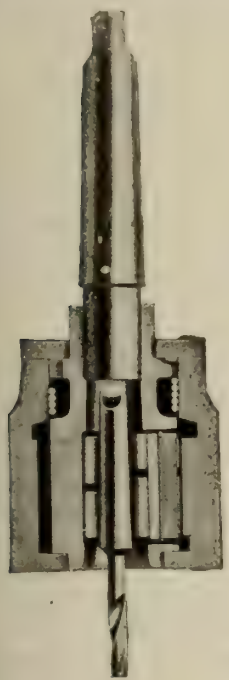
The company contemplates doubling the capacity of plant No. 2 and have made provision in the charter for the manufacture of steel castings and will instal an up-to-date machine shop to be in a position to handle anything offered.

The present officials of the company are Geo. B. Frost, president and general manager; Dr. C. A. Patterson, vice-president and treasurer; J. E. Frost, secretary and sales manager, all three directors and constituting a managing board.

## Personal

Gordon Perry, president of National Iron Corporation, of Toronto, has been appointed chairman of the board of the English Electric Company, one of the largest makers of electrical equipment in Great Britain.

F. W. Evans, manager of the Toronto branch of the Canadian Fairbanks-Morse Company, has returned to the city after a six weeks' vacation. Mr. Evans' health is much improved as a result of the trip.



Alexander Johnston, former deputy minister of marine and fisheries, will be reappointed to this old post in the department. Mr. Johnston resigned his position after ten years of capable service to join the British Empire Steel Corporation, as assistant to Roy M. Wolvin, general manager.

**Safety League.**—The monthly meeting of the executive committee of the Ontorio Safety League was held at the King Edward Hotel on March 8. Among other matters the meeting received a report of the sub-committee, on the annual meeting. This report calls for a two-day safety convention, to be held in Toronto on April 27 and 28. The subcommittee on papers has arranged to have papers presented on Traffic, How to Interest the Employee in Safety, Workmen's Compensation, Falls and Falling Objects, Safeguarding Machinery and School Safety.

**Bought Leaside Plant.**—The Leaside Munitions Company, Limited, have completed the purchase from the United States Government of the large plant erected at Leaside during the latter months of the war. This plant was built for the American Government by the Leaside Munitions Company for the manufacture of twelve-inch shells for the United States artillery, but the plant and its equipment had only been completed a few days when the armistice was signed, with the result that it was never put to its intended use. It will be used by the present purchasers for manufacturing purposes.

# Aikenhead's

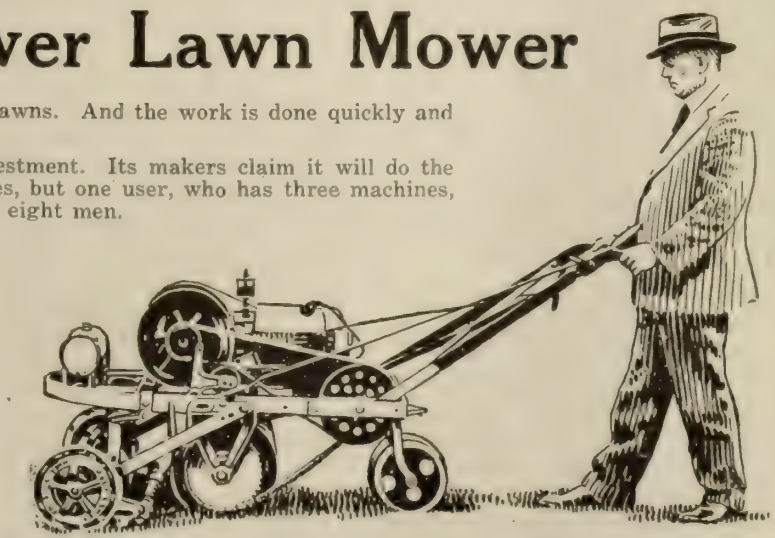
## "Everything in Tools"

## The Wahlstrom Automatic Drill Chuck

Do you discard, or salvage and repair, your tools when the tangs break? Neither is necessary if you use a Wahlstrom Automatic Drill Chuck. Good tangs or broken tangs, it makes no difference, for the Wahlstrom will hold tools whether they have tangs or not! The jaws grip on the **side** of the shank. The reduction in your tool upkeep cost, when you use these chucks, is governed entirely by the number of Wahlstroms operating in your plant.

There's no time lost in waste motion with the Wahlstrom Chuck. It is automatic and instantaneous in action. It enables the operator to make **tool changes in just two seconds,** without stopping the spindle of the machine.

Made in two different styles. One style holds No. 1, 2 or 3 Morse Taper Shank Drills—with or without a tang. The other style is made in three sizes, which hold all sizes of straight shank tools from ¼ to 1 inch.



## The Ideal Power Lawn Mower

Ideal Mowers insure close-clipped, velvety lawns. And the work is done quickly and cheaply in a clean, easy way.

Ideal Mowers are a real money-saving investment. Its makers claim it will do the work of five men with hand power machines, but one user, who has three machines, claims that each machine does as much as eight men.

An important feature of the Ideal Mower is that the power drive is separate from the cutting unit, so that if a stone or other obstacle gets in the way, the cutting unit will automatically stop until the obstacle is removed. Those who have used a mower to any extent will appreciate what this feature will do to prolong the life of the machine.

A booklet describing the Ideal Power Lawn Mower more fully will gladly be sent you.

# Shall Canada Trade With Germany?

ARE we going to trade with Germany? If so, upon what grounds and terms? The matter of German trade is coming up for discussion in many places. Not long since the Canadian Association of British Manufacturers had a fairly pointed argument over the problem, some holding that members had no right to act as agents for what they termed enemy lines in Canada. Others in the association held it would not be fair to restrict members in this way, as it would simply toss business over to others.

And so it goes. Nor can it be said that Germany is standing back while Canadians are making up their minds. Every week seems to show an increase in the volume of German catalogues reaching this country. Nor are they starved-looking publications one might expect to receive from a country that has gone through the experiences of the past few years.

Canadian Machinery asked some of the leading manufacturers to give their views on the matter. Our letter drew attention to the amount of business Germany was already doing here, and to the oft-repeated claim that Germany must be allowed to trade with the world in order to pay off her debts.

### Menace of Cheap Labor

B. H. Neill, sales manager of Canada Machinery Corporation, Galt, holds that the Canadian plant has a right to consideration and protection before the position of Germany is considered. He says:—

"It is our opinion that German goods should not come into the country unless at a heavy surtax sufficient to offset the difference in labor costs as well as the depreciation in German currency.

"If we have to trade with Germany in order to assist her to pay her war indemnity, and by so doing have our country flooded with cheap goods while our own factories and workmen remain idle, better forget the indemnity and put an embargo against goods from a discredited nation. It is not long since every good Canadian was solemnly declaring he would never again buy German goods. How quickly these declarations are forgotten when the dollar is involved!

"Our Customs Department is already assisting German exporters by appraising values on basis of exchange on day of entry. For instance, the other day the German mark was valued at 1 7-10 cents. What protection does this afford the Canadian manufacturer who is helping to pay our own war debts?

We are directly opposed to your suggestion."

### Short, But Very Pointed

Canada Foundries & Forgings, Ltd., Welland, do not mince words in stating the case as they see it. Simply this, in a letter from B. J. McCormick, general sales manager of the company:—

"Replying to your letter of March 8th on the subject of re-establishing German connections, we wish to say that we have no desire to either buy or sell any articles of commerce with these people."

### Not Particularly Interested

The Mason Regulator & Engineering Co., Montreal, have not gone very fully into the matter, as it is one that does not concern them in their business relations. H. L. Peiler, general manager, writes as follows:—

"I am in receipt of your letter of the 8th instant, contents of which are noted, and with reference to which I may state that this company is not interested in products of German origin and I have, therefore, so far not been called upon to form an opinion in the matter.

"There appears to be no doubt that if we as individuals or collectively, should refuse definitely to trade with Germany, it would simply make it increasingly difficult for that country to meet her foreign obligations, and it would, therefore, appear to be a question of our general interests not to base trade relations upon prejudices aroused during the past conflict.

"However, as I have stated above, the question is one that does not directly affect this company's business."

### Straight Talk Here

When J. M. Taylor, president of the Taylor-Forbes Co., Guelph, has anything to say, people generally know exactly where he stands. So in the present case, when Canadian Machinery asked the opinion of the aggressive J. M. about trading with Germany, it was not surprised at the warmth and directness of the answer it drew:—

"Your letter dated March 4th received, and we were very much surprised to learn of the volume of importation from Germany during 1920.

"Our view is we do not want to any business with Germany directly or indirectly. We are just warm-blooded enough to refrain from wanting to do business with the murderers. We are not built on the lines of some people who have no memories and can forgive and forget over night.

"The very thought of doing business with Germany is torture enough, without actually doing business with them.

"We grant you that the war indemnity must be paid, but let Germany swelter in paying it. If it will torture them and make them bleed mentally to pay the indemnity we hope those in power will keep up the good work of torture."

### Don't Penalize Canada

A. M. Kerr, secretary-treasurer of the Preston Woodworking Machinery Co., holds that Canadian manufacturers need some consideration, as well as Germany, and that there should be protection against cheap German goods. "Trading with Germany," says Mr. Kerr, "is a matter to which we have not given much attention since German competition does not concern us a great deal. We agree with what you say that if Germany is going to pay the huge war indemnity, we must be prepared to go ahead and trade with her as formerly, but Canadian manufacturers should have a chance, which they will not have if Germany, at the low price of the mark, can underbid her all along the line.

"If they are able to ship goods in here and prevent us from manufacturing them it looks to me as if it would be Canada that would pay her indemnity. We don't think that Canadian manufacturers should be penalized because the German mark is worth so little and selling so much below par that they are able to ship goods into Canada so easily in competition with Canadian industries. The value of her money eliminates competition almost altogether, and we would all suffer while she pays off her indemnity. Let our country put up a tariff barrier sufficiently large to make it a competitive proposition, and then I would say it would be more nearly as it should be."

# MONTREAL NOTES

Capt. B. G. Grant, general manager and Canadian director of Armstrong-Whitworth of Canada, who has been absent on a business trip to England for the past six weeks, during which time he attended a director's meeting of the company, is expected back in Montreal about the 18th of the month.

---

The water is now being emptied from the Lachine Canal preparatory to the annual cleaning and inspection that is always done before the opening of navigation. Special examination will be given to all the lock sills, owing to the fact that some of them were subjected to severe strains last season by large and heavy-laden vessels. This spring inspection is a very important part of the year's work, as it minimizes the possibility of serious tie-up at a busy period of the season.

---

It is expected that an early opening of navigation of the St. Lawrence will take place this spring owing to the mild spell of weather that has prevailed during the past several weeks. The Government anticipate putting the ice-breakers into service this week and should the weather continue as at present there is every hope that shipping will be moving on the river about two weeks earlier than for some years back. The fact that both the Government ice-breakers will be on duty in the river this year adds to the possibility of clearing the ice at an early date.

---

At the regular monthly meeting of the Canadian Railway Club, held in the Windsor Hotel, Montreal, on March 8, one of the largest gatherings of the year was favored with several special features of interest. Before the regular business of the evening was commenced, a presentation was made to Gordon W. Dunn, a member of the club, this being in the form of a bronze medal of the Canadian Royal Humane Society, for the rescue of Miss Schoenart, of Philadelphia, from the Niagara River, on the 15th of September last. The paper of the evening was prepared and read by Samuel Lynn, general master car builder of the Pittsburg and Lake Erie Railroad, the title being: "Repairs and Maintenance of Steel Freight Cars." The paper was highly interesting and instructive and was illustrated by lantern slides.

---

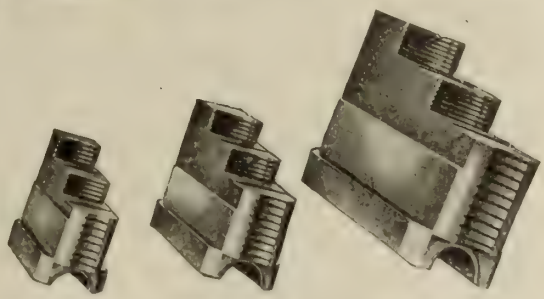
Operations will soon be started on the dismantling of the Old Knox Church, at the corner of Mansfield and Dorchester Streets, in Montreal, to make room for the large addition that the Sun Life Insurance Company intend making to their present building. This property was acquired at the time of the original purchase, but up until the present the additional office space was not required. It is expected that operations will have advanced sufficiently far enough to lay the corner stone of the new building some time in May, this year being the jubilee of the company. The cost of the new addition will be approximately $1,250,000 and it is expected that it will be completed in 1923. The building will, in every respect, be identical with the large one now used by the company. The architects are Darling and Pearson, designers of the new Government buildings.

---

### NOVEL FORM OF WARNING

The possibility of using stenches as a warning in mines was recently investigated by the Bureau of Mines, U.S.A., and forms the subject of a special report. It is stated that stenches as a warning have a decided action; they exert a positive effect because of their offensiveness. When miners smell a disagreeable stench they instinctively desire to obtain pure air at once. The velocity of air through compressed air lines in metal mines is usually hundreds or even thousands of feet a minute, so that transmission of a stench is rapid. Warning by stenches is particularly adapted to mines equipped with compressed air. In coal mines, where only the ventilating current is available for carrying a stench the average velocity is low, of the order of 200 feet a minute or less. If the velocity of the air in a compressed air line is rapid, a small quantity of material would give more effective warnings than the same quantity in a ventilating current, because of being liberated in concentration at the points where most needed, and being less diluted with air. However, the method may be useful in some mechanically ventilated mines where compressed air lines are unavailable. Of the chemicals tried, it would appear that compounds of mutyl mercaptan are the best adapted for the purpose in view.

---



### MICRO-GAGE SET

The Van Keuren Company, of Boston, Mass., are now offering to the trade a set of micro-gages which give dimensions in any desired thousandth of an inch from 0.4 to over 5 inches by combining two or more of the various gages. The set is very serviceable for both tool-room and production work. The set consists of only sixteen separate gages. The gages are cylindrical and made of tool steel, heat treated and seasoned, faces being ground and lapped to a mirror finish. It is stated that the working faces are held within a few millionths of an inch for parallelism and flatness of faces. At the standard temperature of 68 degrees it is claimed that the size of any block is correct to 0.000025 of an inch.

# DOMINION CHUCKS

STEEL OR CAST-IRON BODY
BUILT FOR HEAVY DUTY

## The Jaws Are Extra Strong

THEY are drop forgings, made of best quality steel, heat-treated and hardened. The threaded portion of jaws form a half nut for the setting-up screws. Have stood the test of heavy duty work in our own shops where accuracy was the only accepted standard.

## New Catalogue

The Elk Fire Brick Company of Canada, Ltd., Sun Life Building, Hamilton, have issued a bulletin describing their products. This company manufacture refractory brick in all shapes, for furnace linigs, blast furnaces, cupolas, fire brick arches, checker brick, etc. The catalogue illustrates every different shape, and gives information on the sizes available, and the guarantees given, also the deviations from specifications allowed. The shapes shown have been adopted by the Refractories Manufacturers' Association as standard. In addition to the foregoing there are a number of tables showing numbers of bricks required of various shapes to make certain size linings. Other useful tables are fusion points of different materials, and comparison of the different thermometer scales, circumference and areas of circles, and weights of various materials.

## Marine Engineering

It has been announced by Admiral Benson, chairman of the Shipping Board, after hearing claims of coast shipping representatives, that fifteen vessels will soon be allocated to service between Pacific coast ports and the Orient.

The death occurred at Sarnia on March 6 of Capt. Walter E. Linton, a well-known resident of Mooretown. The late Capt. Linton was one of the best-known sailors in this district, and had been sailing out of great lake ports for the past 26 years.

The steamer Dougald Mac, formerly the Columbia, well-known on the River St. Lawrence as a coal carrying steamer, is being converted into a tow barge by the Sincennes McNaughton Company. The vessel will ply during the coming season between Montreal and Oswego in the coal trade.

A shipbuilding correspondent of The Morning Post, London, England, writes that almost 20 per cent. of the shipbuilding berths in England are vacant, and shipbuilders have no contracts on hand for ships to be laid down. In a short time, as the ships under construction are completed, the number of vacant berths will be increased. Within the last twelve months twice as many orders have been cancelled as have been placed. While costs remain at the existing high level there is no chance of British shipbuilders getting new orders in any quantity, and more particularly is this true when there is so much German tonnage being offered for sale on behalf of the Government. Shipping and shipbuilding have outstripped the needs of commerce.

# HENDEY

## *"Hendey Millers Give No Trouble At All"*

This is what the foreman of the plant of H. G. Sall Company says. And he is in a good position to know, for much of the work must be done within limits .0005 inch.

Hendey Millers are made in both plain and universal types and are well adapted to both tool work and general manufacturing.

Every Hendey is the direct result of over fifty years' successful machine tool building.

Every Hendey is made of high-grade materials throughout. They are built up to a standard, not down to a price.

Every Hendey is rigidly tested and is then sold at as low a price as possible.

Is it any wonder, therefore, that those who know the Hendey praise it?

# The Hendey Machine Company

## Torrington, Conn., U.S.A.

*Canadian Agents:*

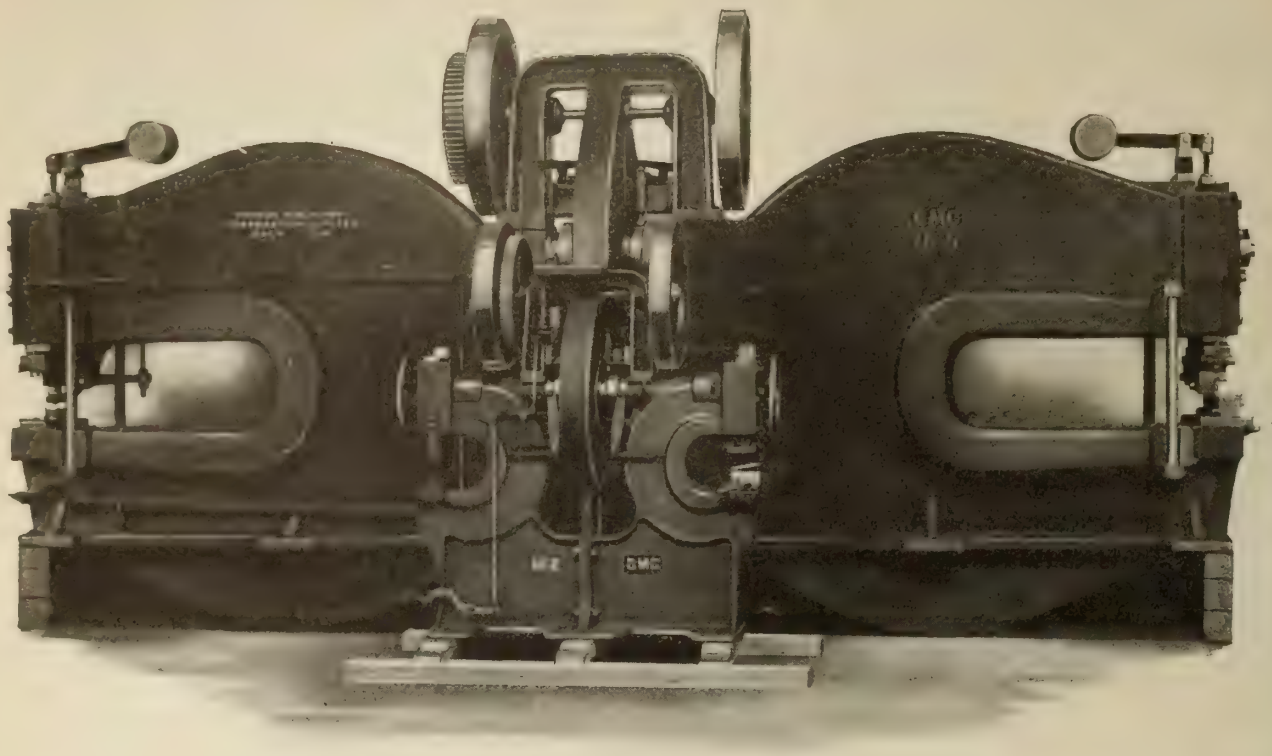
Williams & Wilson, Montreal.

*If interested tear out this page and place with letters to be answered.*

# TESTED BY TIME

This Adjustable Snap is no experiment. Correctly designed to meet the severest tests, it has proven its value through years of service.

Easily set to exact sizes—rigid and dependable—economical to maintain—adaptable to different sizes and changed limits—this gage helps to reduce gaging costs.



Carried in stock for your convenience by all Johansson dealers.

## Johansson Dealers

*Williams & Wilson, Ltd., Montreal, Que.*

## *C. E. Johansson, Inc.*

POUGHKEEPSIE, N.Y.

# C.M.C. Punches and Shears

are made by skilled Canadian workmen from the best materials available. They are well proportioned, heavy tools, with sufficient rigidity to enable them to successfully perform the heaviest work.

The controlling mechanism is simple but effective, being placed within the convenient reach of the operator, the machine being thus kept continuously under his instant control.

We illustrate here our No. 5 Double-End Punch and Shear with 60″ throat and No. 2 Double-End Punch and Shear with 12″ throat. These machines were both ready for our customer on the same day, and demonstrates the range of punches being turned out by this company.

**Full particulars and prices on request.**

## "Seventy Minutes to the Hour From Now On"

No—we don't mean that an employee is to work 10 minutes for nothing.

But we do mean that 50 minutes working time to the hour "doesn't go" any more. Lost minutes must be paid for by those who lose them.

The times are too serious to permit of the loss of working time. Every minute paid for must be delivered. "Ringing in" at 8 a.m. and starting at 8.15 must stop. Quitting work at 5.15 instead of the proper stopping time, say 5.30, must stop. Costs must be reduced. One big important way is to be sure you are getting full value for every cent you spend—for working time or anything else.

INTERNATIONAL TIME RECORDERS at the department or shop door will cut down waste in "walking time" or loitering between factory door and bench.

International Job Time Recorders in the department will give accurate, unchangeable PRINTED figures for every working minute put on a job or process. No trouble then to find out *EXACTLY* what your costs are.

**International Business Machines Co., Limited**
300-350 Campbell Avenue, Toronto
F. E. MUTTON, Vice-President and General Manager

For your convenience we have Service and Sales Offices in Vancouver, Winnipeg, Walkerville, London, Hamilton, Toronto, Ottawa, Montreal, Quebec, Halifax, St. John's, Nfld.

*Also manufacturers of International Dayton Scales and International Electric Tabulators and Sorters.*

# SMALL TOOLS

## Pratt & Whitney Adjustable Blade Reamers

These reamers have eccentric relief and can be set to size without regrinding. They are unexcelled for design and simplicity and ease of adjustment.

The eccentrically relieved blades are stronger than others, do not chatter, and produce a smoother hole. The hand, shell and fluted chucking reamers have interchangeable nuts, screws and wrenches. The bottom of a hole can readily be faced.

By a simple adjustment of the blades the reamer can easily be set to size, without regrinding.

*Prompt service is assured at our nearest store, where P. & W. Small Tools are carried in stock for immediate delivery. Place your order there to-day.*

# CLECO PRESSURE-SEATED AIR VALVES

*"The Valve That Never Leaks"*

Style R.A.

**Style R.A.**—90 degree Angle Valve. Sizes: ¼-in., ⅜-in., ½-in. and ¾-in. pipe thread Outlets. Inlets are one pipe size larger. Hose falls away without bending.

Style A.

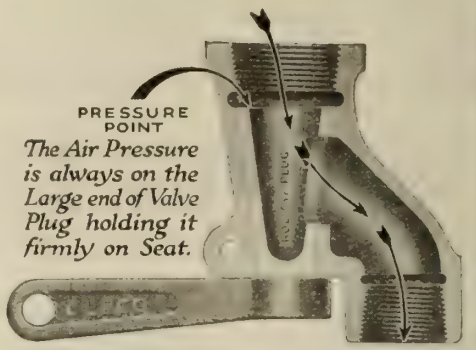
**Style A.** 30 degree Angle Valve. Sizes: ½-in. and ¾-in. pipe thread Outlets. Inlets one pipe size larger. Hose falls away without bending.

**Style P.O.** Made in sizes ¼-in., ⅜-in., ½-in., 1-in., 1¼-in., 1½-in. and 2-in. standard pipe thread Outlets. Inlets one pipe size larger.

Style P.O.

**Style M.O.** Has 1-in. pipe thread Inlet and Male Bowes Coupling Outlet and connects with Bowes Couplings. Sizes ¼-in. to ¾-in.

Style M.O.



**The Valve That Improves With Use.**

**Require No Attention After Installation.**

Style S.L.

**Style S.L.**—Straightway Valve. Sizes: ½-in. and ¾-in. pipe thread Inlets and Outlets. Adapted for Vertical or Horizontal Pipe Connections.

Write for Illustrated Bulletins Nos. 46, 48 and 49

Style L.W.

**Style L.W.**—Three Way Valve. Sizes: ½-in.., ¾-in, and 1-in. Have 1-in., 1¼-in. and 2-in. Inlets and ½-in., ¾-in., and 1-in. Outlets respectively.

Style F.W.

**Style F.W.**—Four Way Valve. Sizes: ½-in., ¾-in. and 1-in. Have 1-in., 1¼-in. and 2-in. Inlets and ½-in., ¾-in., and 1-in. Outlets respectively.

# HEPBURN

*A Pump That Will Pump*

A large rubber factory installed one of our pumps recently. The engineer had never had one under his charge before. What was his verdict? "I have never seen a pump work like that before," he said. It started up so slowly he could hardly see the piston rod move, then tipping over the starting lever with his finger the piston plunged forward, giving a gushing discharge. There was perfect cushioning due to the self draining feature of the cylinder—and a full stroke every time. There are no valve levers or tappets to give trouble, and the pump needs little attention.

Let us hear from you before you order your next pump.

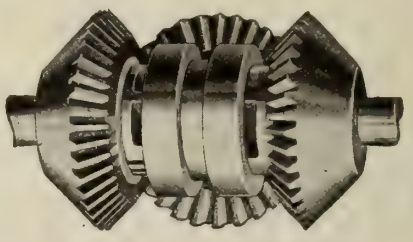
# THE JOHNSON FRICTION CLUTCH

## Clutches for Reversing Functions



Johnson Clutch Installation on Newton Milling Machine

A reversing clutch is a very common requirement on machinery, and one which is encountered in many different forms. Whatever the situation may be, a Johnson Clutch offers the best method of handling it.

The bevel gear assembly shown here is one of the ways in which a Johnson Double Clutch is frequently applied for reversing functions. Many of the best machine tools are equipped in this manner.

# LINCOLN ARC WELDER

## *Successfully Applied to Cast Iron*

Welded cold—by old methods it would have been necessary to heat this entire block.

Air Compressor Cylinder with the electric weld completed and tested against water pressure.

ON the left is an illustration of a Cole Aero-8 Motor. The chalk marks indicate where the cylinder wall was cracked.

By means of a special electrode Lincoln Electric Welding made this repair without preheating.

This repair cost the owner less than 10% of the replacement cost.

Lincoln Electric Welding is the proper process for such work—just as it is for making repairs to Air Compressor Cylinders similar to the one shown in the lower picture in this advertisement.

Lincoln Electric Welding has vast possibilities. Let a Lincoln Engineer explain them to you. Get in touch with us to-day.

*"Link Up with Lincoln for Performance and Service"*

OPERATED IN CONJUNCTION WITH A CONTINENT WIDE NET-WORK OF DISTRIBUTION STATIONS

**"Liquid Air" Oxygen Means a Saving in Transportation**

With a network of Factories, not only planned but in actual operation, and a number of Distribution Stations situated at all large centres all over Canada, Purchasers of Oxygen can obtain their supplies at a point very near to the point of consumption. This completely obviates heavy freight charges on cylinders and assures an immediate supply at any time within a few hours and even minutes after the orders are placed.

All cylinders conform to the specifications of the Canadian Railroad Board and are made to ensure safety without unnecessary weight. When purchasing "Liquid Air" Oxygen you not only save on freight, but in very many cases this expense is almost eliminated.

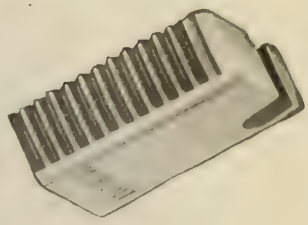
# Buying a Pig in a Poke

The buying of advertising space used to be buying "a pig in a poke." The quantity and quality of circulation was shrouded in mystery and often the bag was tied against investigation.

That day has passed. The advertiser no longer depends upon "mere claims." The Audit Bureau of Circulations has untied the strings to the sack and the circulation of the better class of publications is thrown open for the most searching scrutiny.

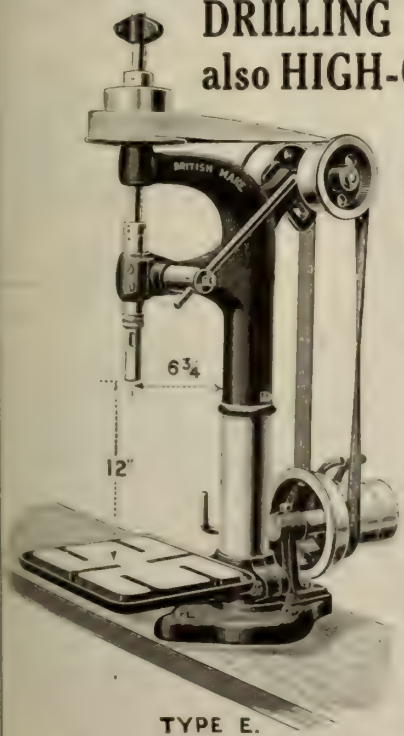
In buying advertising space in the Canadian Machinery you are not buying "a pig in a poke." Our A. B. C. statements will stand the analysis of the most exacting investigator.



*If interested tear out this page and place with letters to beisers listed under proper heading.*

# MURCHEY TOOLS

*The Secret of Good Threading Lies in the Chasers*



It's the chasers that bear the brunt of your work. Upon their sharpness, strength, and interchangeability depend the speed and accuracy of your output. You will find Murchey Chasers strong and accurately designed. When one set wears down it's a simple matter to put in new ones. We give special service in supplying them. This is one of the reasons why Murchey Taps and Dies will actually boost your production fifty per cent.

Murchey Tools belong to the advanced method of production. They are simple and convenient to operate and are strong and durable. You are assured of 100 per cent. satisfaction from every Murchey Tap or Die. Let us prove it. A sample Tap and Die will cheerfully be sent on approval.

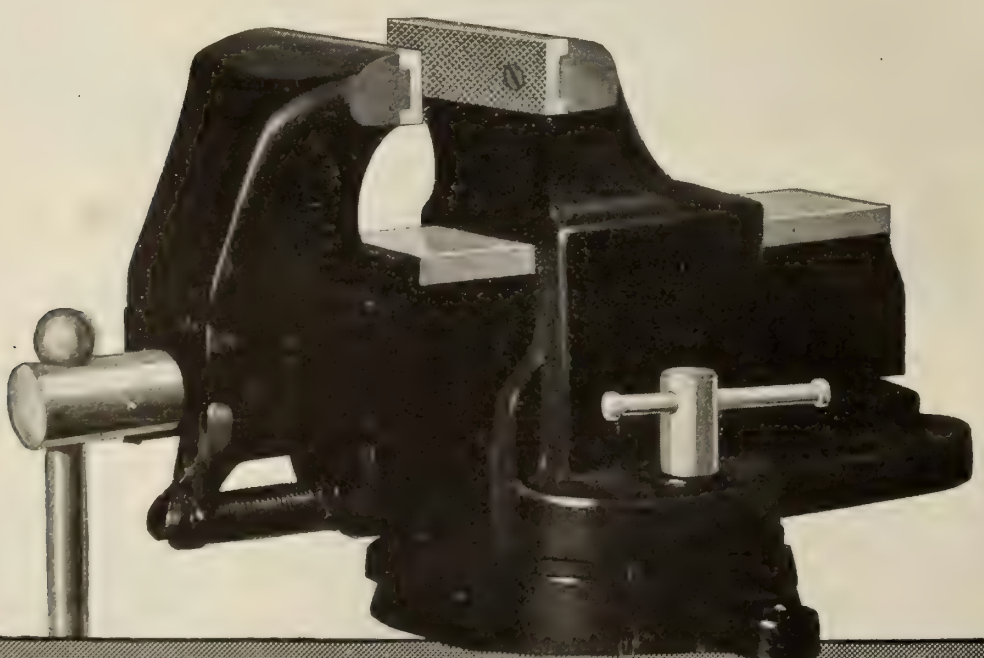
# 30 Times Faster Than Ordinary Vises

THIS Columbian Quick-Acting Vise, with a jaw opening of 6 inches, can be opened the full length of the screw in ½ of a second. It takes *30 times as long* to rotate the handle and open an ordinary vise of the same size.

This new vise is an addition to the many other types of machinists' vises already included in the Columbian line. It is extremely simple, there are no complicated parts to get out of adjustment. A slight pressure of the trigger with the forefinger releases the screw and allows the beam to slide freely in either direction. Made in stationary and swivel base types; 7 sizes from 3 to 7 inch jaws, opening from 4½ to 12 inches. The jaw faces are removable and may be replaced with specially shaped jaw faces.

The new Quick-Acting Vise, however, is a highly specialized vise designed for machine shops in which a great many similar pieces pass continuously through the same operation. On such work as this, in an accurately timed test, an operation requiring two settings in the vise was done in an ordinary vise in 24 seconds. With a Columbian Quick-Acting Vise the same operation was done in 15 seconds.

This is a saving of 37½ per cent.



Like all Columbian machinists' vises this Quick-Acting Vise is made of malleable iron and is twice as strong as any cast iron vise of the same rating. The famous Columbian Sledge-Test proves this conclusively.

# Two Operations
## at the same time

Here is one of the many pieces that can be produced to advantage. Five pieces held in fixture, making total length of cut 6 9-16 inches. These fixtures are designed to carry two rows of five pieces, each row representing a different operation after the first cut, and the table has revolved to its loading position, the pieces are reversed in the fixture and is then ready for milling the radii on the opposite ends. In this way two operations can be performed without waiting for one operation to be completed.

**Compare this with your work and investigate this manufacturing proposition.**

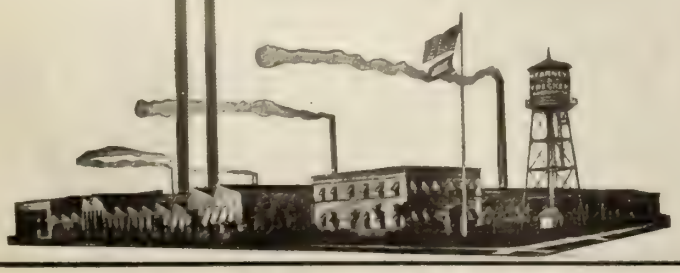
# MILWAUKEE MILLING MACHINES



## *Vertical Milling*

THE main construction principles of the Milwaukee Vertical Milling Machine do not differ from our horizontal type—i.e., the heavily-ribbed, box-section column; the solid top, box-section knee; the constant speed drive; the automatic flooded lubrication system—these are embodied as being characteristics of Milwaukee Milling Machines in general.

On our Vertical Milling Machines, the spindle is non-adjustable, except for wear. All adjustments for practical purposes can be made by the knee alone, the same as on horizontal milling machines. The non-adjustable spindle construction is decidedly rigid and will maintain alignment through many years of service.

# Would You Like to make some Extra Money?

Of course you would. Well then, why not do so? Canadian Machinery is always on the lookout for well-worth-while ideas, and are willing to pay a good price for them..

We are often asked, "What sort of ideas do you want?" Briefly, what we are desirous of obtaining is this, "Any idea that has proved of value in the machine shop, drafting room, or tool room." Think of how you got over some difficulty, a ticklish piece to hold in the lathe, or perhaps how you increased production on some particular piece. Any idea that saves time or money in the machine industry will appeal to us. Never mind the style. Write it as best you know how. We will put the finishing touches to both the wording and the sketch. Start in **NOW** and send us something of such a nature.

# *Switch-On Little Giants*

THE problem of the hour in leading industries is *lower production costs.* And labor-saving tools are proving themselves a leading factor in its solution.

Especially is this true of Little Giant Portable Electric Drills. Their performance records under hardest conditions and on all classes of work have proved the economy of buying "cheaper *drilling*—not cheaper *drills.*"

The thoughtful tool-room foreman invariably considers *quality first* in specifying tools that occupy the important place in the production program that portable electric tools occupy today. So does the far-sighted buyer who considers future performance ahead of the dollar of today. And the judgment of both in selecting *Little Giants* is confirmed by a large majority of the world's biggest portable electric tool users.

Every electrical and mechanical feature of Little Giant Electric Drills and Grinders reflects *built-in quality.* Ample overload capacity, perfect commutation, long-wearing stub-tooth gears, *full-type* ball-bearings and non-arcing switch control—are a few of these features. Know *all* about Little Giants.

Built in A.C., D.C. and "Universal" types. Write for bulletins.

## Full Time and Overtime

HEAVY service imposes a tremendous strain on your plant machinery. Every individual part of every unit must be properly lubricated to carry the load.

Scientific selection of your lubricating oils is every bit as important as the careful choice of mechanical units themselves.

Imperial Lubricants, backed up by Imperial Service, will solve your lubricating problems. Increased production, minimum depreciation and lowered lubricating costs surely follow.

There's a right grade of oil for every service condition; the quality is always uniform, with ample supplies conveniently available. Imperial Lubrication Engineers will gladly advise you on all lubricating problems.

*Write to 56 Church St., Toronto.*

SKINNER CHUCKS

# A Book of Information For Chuck Users

A book that shows the various types of chucks and their uses should be helpful to the machinery buyer and machinery salesman.

A book containing this information, together with suggestions as to the care of chucks, best methods of setting up and best way to handle certain operations, should be useful to the mechanic.

We have just published such a book

## "CHUCKS AND THEIR USES"

It contains information based on more than thirty years' experience in building chucks.

We shall be glad to send to any interested person a copy of "Chucks and Their Uses." We will also send to superintendents or factory managers a supply of these booklets for distribution among the mechanics who may be able to make use of them.

There is no obligation—no charge. Our compensation is the knowledge that we are assisting users to better understand the proper use of chucks.

***Send for your copy now. No charge.***

# Landis Bolt and Pipe Threaders have a World-wide Reputation for Reliability and Accuracy

Landis Bolt and Pipe Threading Machines do better work more cheaply—and in less time—because of the distinctive design of the Landis Chaser, which operates in the same manner as a lathe tool. Placed at a tangent to the work, the bearing and friction on the cutting edge are at a minimum, allowing the machine to be operated at a higher speed than is possible when a hobbed type of die is used.

The diagram illustrates in a proportional manner the salient characteristics of the Landis Chaser as compared with the hobbed type die. It shows the long life of the Landis Chaser; the natural clearance between the serrated face of the tool and the surface of the work; the permanent throat; the variable rake angle, and the fact that both right and left-hand threads can be cut with the same set of chasers.

All of these features are contributive to economical production and explain, in part, why Landis Thread-Cutting Machines are considered standard equipment by leading manufacturers, whose hardest jobs they handle with complete satisfaction.

Our nearest branch will gladly send detailed information.

# Tooling the Modern Turret Lathe

## Machining magneto cam case—Use of special jaws — holding concentricity of work — Machining gun-metal bush—Automatic threading tool—Machining flywheel for motorcycle.

*By A. H. Lloyd B. Sc., M.B.E.*

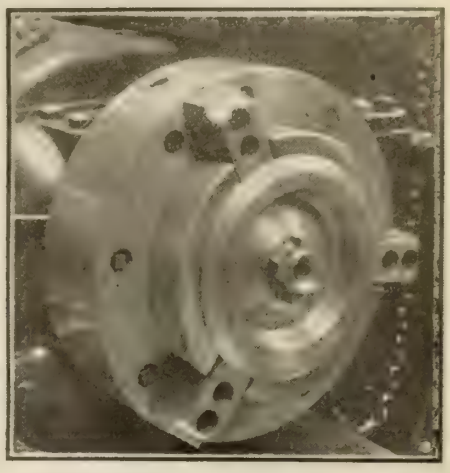

FIG. 11—CHUCKING MOTOR-CYCLE FLYWHEEL

HAVING dealt with chucking and fixtures in a previous article in Feb. 17th issue of Canadian Machinery, let us next consider some interesting examples of tooling.

The first example shown at Fig. 1 illustrates the method of machining a magneto cam case on a Herbert No. 4 capstan lathe. This piece is made from a brass stamping from which there is a comparatively small amount of metal to be removed, but the tolerances, as is usual in magneto work, are very fine.

Fig. 12 illustrates the first operation. On looking at the piece in the chuck you will see that there is an interesting set of special chuck jaws which are shown in greater detail in the lay-out at Fig. 13. The tools are numbered on this lay-out in the order in which they are applied to the work, and at the top you have a front view of the special jaws. These are made with a short shoulder, so that they square up the flange and provide a definite end location.

Tool No. 1 is a facing tool for the end, which is used in the square turret. No. 2 is a flat drill. No. 3 is a standard knee-turning tool carrying a cutter for turning the outside diameter, and a special boring bar carrying a flat cutter for rough boring and facing the bottom of the large bore. No. 4 is similar and finishes the surfaces corresponding to those machined by No. 3. There is, however, an additional cutter for cutting the groove at the bottom of the large hole. No. 5 is a single point boring bar for sizing the bore, whilst No. 6 is a boring bar carrying a cutter head which finishes the small bore, forms the radius at the mouth of the small bore, and forms the external radius on the end of the casting. It will be noted that tools 3, 4, 5 and 6 are all piloted in the chuck steady bush. It is good practice to make these steady bushes taper on the outside and fit them into a liner with a taper bore which is left in the chuck. This taper is approximately the same included angle as a Morse taper, and facilitates

FIG. 1—FIRST OPERATION ON MAGNETO CAM CASE.

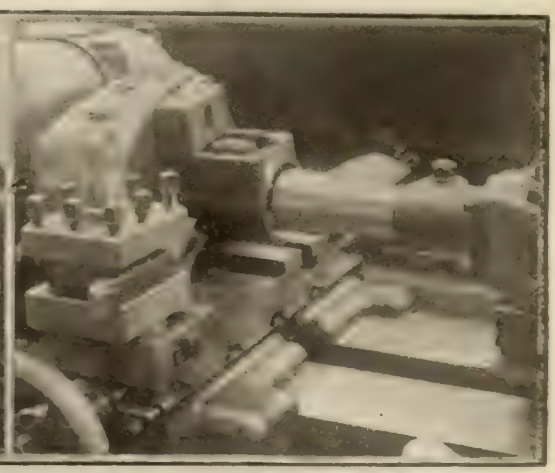

FIG. 4 BORING YOKES FOR LIGHTING DYNAMOS.

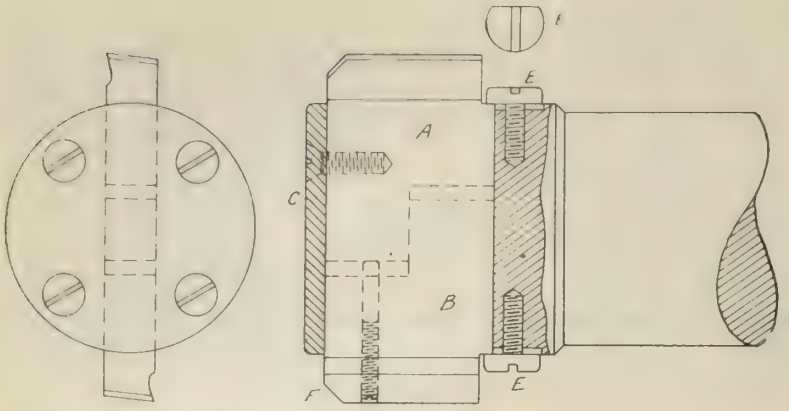

FIG. 5—DETAIL OF FLOATING CUTTER BAR.

removing the steady bushes from the chuck.

### Second Operation

In the second operation shown at Fig. 3 the method of chucking deserves some attention, as it illustrates how the concentricity of the work accomplished at the second operation is obtained in relation to the first operation. The steady bush in this case is made a sliding fit in the large bore finished at the first operation and on this the work locates. Gripping and driving are done by the soft jaws, which are bored out true, but it is important to note that concentricity is not dependent upon the truth of the soft jaws, but upon the locating plug. Tool No. 1 in the square turret faces the flange and the end, 1A being used for the finishing operation on the same surfaces. No. 2 is a standard knee-turning tool carrying a rough turning cutter and a piloted four-flute reamer for rough boring and bottoming. No. 3 is a similar combination to No. 2, but takes a second cut. No. 4 is a boring bar carrying an undercutting tool, which produces the groove at the bottom of the bore. No. 5 is a sizing boring tool. No. 6 is a knee-turning tool for sizing the spigot, and uses one of the first operation boring bars as a pilot, but without cutters. No. 7 is a boring bar for forming the radius in the small bore, and carries cutters for forming the internal and external radii.

The next photograph, Fig. 4, shows the lay-out for boring a yoke for motor car lighting dynamos. Whilst it is quite an ordinary tool lay-out it has one point of interest in showing a method of sizing holes, which is, to my mind, rapidly replacing adjustable reamers. In sizing holes 1 in. and upwards our firm recommend the use of boring bars with adjustable floating cutters, which produce a very smooth and accurate hole with a minimum of trouble. In the illustration shown the floating cutter bar is in position in front of the work, and at Fig. 5 is given the details of construction.

The cutter is made in two parts, "A" and "B," which are a sliding fit in a slot across the end of the bar. In this slot the cutter is retained by the front plate "C," and the amount of transverse movement or "float" is limited by the screws "E," which overlap the slot. The flat on the head of the screws allows the cutters to be withdrawn when either of them is partly turned. The two parts of the cutter are separated by the screwed pin "F," which also provides the diameter adjustment. When screwed in the diameter produced by the cutters is increased and vice versa. Each size of bar will take several sizes of cutter, and each cutter may be adjusted from 1-16 in. above to 1-16 in. below nominal size. The previous boring bar should preferably be of the single point type and should leave about 0.005 in. to 0.007 in. for the sizing bar to remove. These tools have been standardized for holes from 1 in. to 5 in., and have been made for bores as large as 10 in., with satisfactory results.

### Machining Gunmetal Bush

Next example, Fig. 6, shows the lay-out for machining a gunmetal bush, a detail of which is given in the right-hand corner. This is a very good example of a capstan lathe lay-out, which is tooled up with a view to eliminating all unproductive operations. The tolerances are not particularly fine, .0015 in. up and down being allowed on the bores, the same on the threads and the small diameter. The large external diameter is not important. Chucking is done in a Coventry chuck by gripping with special jaws on the hexagon head, and whilst the jaws are being tightened the tapered plug 1 is brought into position and centres the core. No. 2 is a standard knee-turning tool, carrying a special turning holder with two cutters for dealing with the two external diameters simultaneously, and a boring bar with three boring cutters and one chamfering cutter. The design of this rough boring bar embodies one feature which is well worth noticing. It will be realized that with two turning cutters and three boring cutters operating on the casting simultaneously, there is a very strong tendency for the work to move in the chuck jaws in view of the overhang and the consequent leverage. The first cutter to reach the work is the second boring cutter from the front, which starts to bore and traverses about 3-8 in. before any of the other cutters come on. The diameter behind the second cutter is made a few thousandths less than the size of the rough bore, so that when the bar enters the bore it acts as a steady as the turning cutters and remaining boring cutters come on. By this means a coarse feed can be used without any danger of the work moving in the chuck.

No. 3 is a similar tool for the finishing operations, but in this case the boring bar does not fit the hole. No. 4 is a revolving steady peg, which is

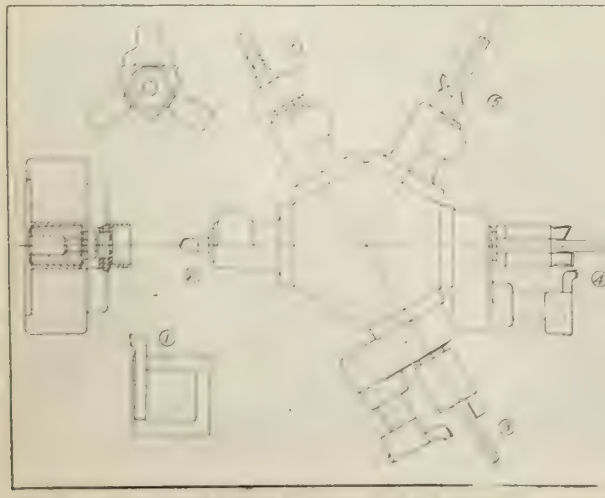

FIG. 2—FIRST OPERATION LAYOUT ON MAGNETO CAM CASE.

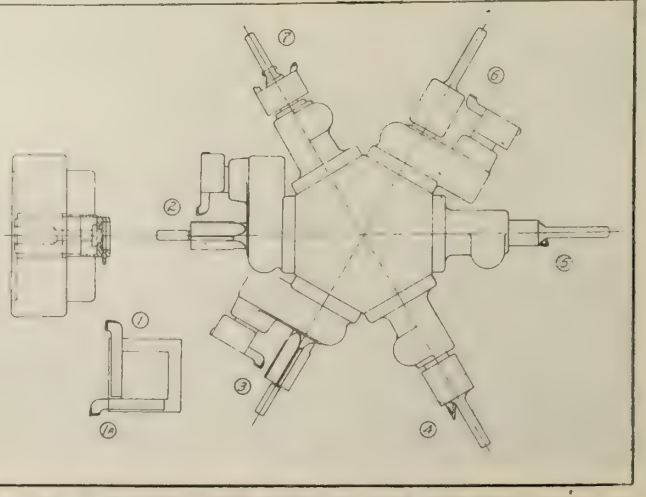

FIG. 3—SECOND OPERATION ON THE MAGNETO CAM CASE.

brought into the work when applying the form tool holder 5, carried on the back of the cross slide. The form tool holder carries a chamfering cutter, chamfering and facing tool, a grooving cutter, and a chamfering and facing tool for the end. Tool No. 6 provides the means for cutting the external threads, and is the "Coventry" patent automatic threading tool. In this there are six chasers, the threads of which are in pitch with each other, but each chaser cuts a thread a little deeper than the one which precedes it, the last chaser forming the full thread. The cross slide is set in to a stop, and the chasing mechanism engaged. The chasers then come successively on to the work until the first chaser has reached the groove.

By this time the bar at the rear of the tool holder has come in contact with an adjustable stop on the bed, for arresting the bar which now slides through the holder. This bar is stepped and successively the chasers pass over the step and are withdrawn from the work. It will be noted that the first chaser has actually tripped. During the chasing operation the work is still supported by the revolving steady. The actual time for cutting the external thread, which is done at one traverse, is 4 seconds. Tool No. 7 is an eccentric recessing tool for cutting the groove at the back of the internal thread. This type of tool is better for this particular job than the ordinary recessing tool slide, since it is tied up to the work by a revolving bush running on the tool itself. No. 8 is a "Coventry" collapsing tap which cuts the internal thread in three seconds. The machining time for the complete lathe operation is two minutes.

Fig. 7 illustrates the machine set up on the operation just described and gives a good view of the automatic threading tool, the collapsing tap, the form tool holder, and the knee-turning tools. A detail of the construction of the automatic threading tool is given at Fig. 8, which is a plan view with the cover removed. The stepped bar which retains the chasers is clearly seen in the cutting position; three of the chasers have been withdrawn and the fourth is about to trip. Withdrawing is effected by spring detents, one of which lies above each chaser. They project through the rear of the tool holder, and a pivoted lever is provided to push them into the cutting position before commencing the next piece of work. Spring return is provided for the stepped former bar, so that when the chasers are pushed forward into the cutting position the former bar shoots from right to left.

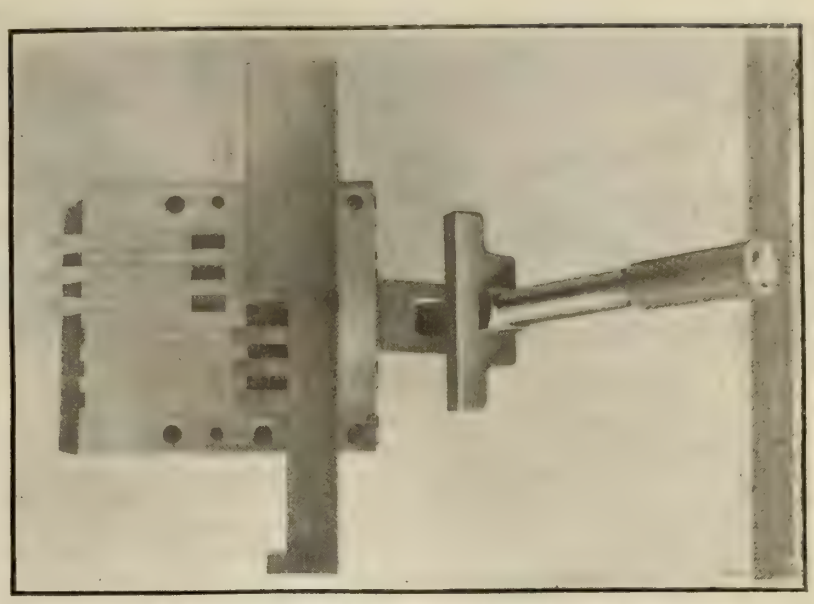

FIG. 8 DETAIL OF THE AUTOMATIC THREADING TOOL.

### Machining Flywheel

Coming to some larger work we will next consider a lay-out of tools for machining the motorcycle flywheel shown at Fig. 9. This is a component of the Scott motorcycle and is made from a mild steel drop forging. The outside diameter is 9 in., and the overall length about 2 3-16 in. It requires to be machined over all, except for a fluted portion on the boss, which is, of course, inaccessible as a lathe operation. The boss is counterbored from either side and tapered, the tapers meeting in the middle. There is also a small spigot on the boss, which requires to be accurately sized. Generally speaking, the machining on the two sides of the flywheel is identical, except that in one case the dished web is concave, and in the other convex. It is, however, important that the machining on both sides should be concentric and one of the inspection tests is to mount the flywheel on its cranks, which fit in the two taper portions, and run the whole arrangement between centres. The outside and the sides of the flywheel must then run true within very close limits.

Fig. 9 illustrates the first operation, in which the stamping is chucked by gripping under the rim. This method of chucking has the advantage that the outside diameter can be machined right across without the necessity of matching up. In the choice of a chuck for turret lathes it is important to choose

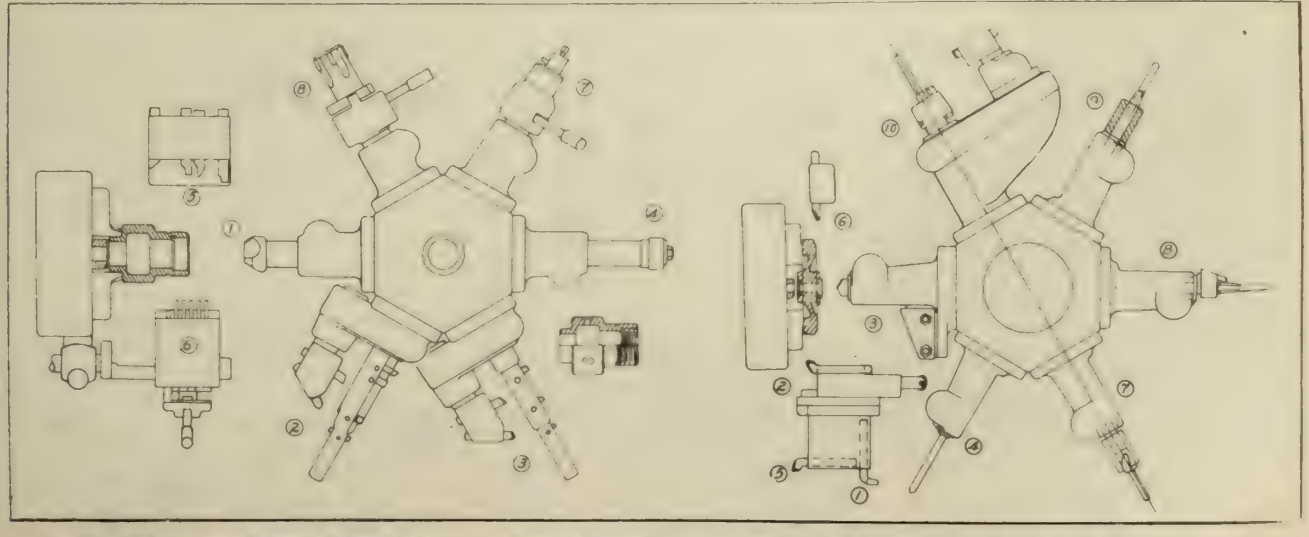

FIG. 6—LAYOUT OF TOOLS FOR MACHINING GUN-METAL DISTRIBUTOR BUSH.

FIG. 10—LAYOUT OF TOOLS ON FIRST OPERATION OF MOTOR CYCLE FLYWHEEL.

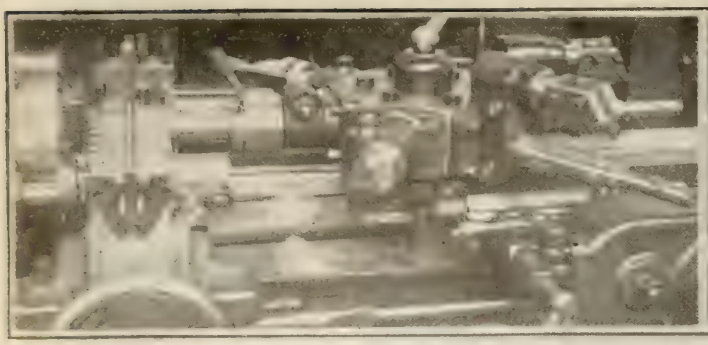

FIG. 7—SET UP FOR MACHINING GUN METAL DISTRIBUTOR BUSH.

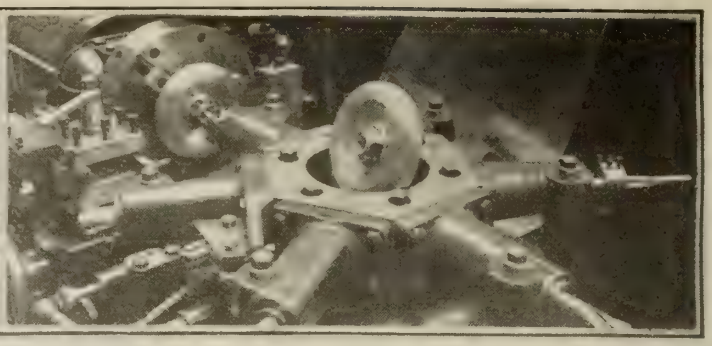

FIG. 9—FIRST OPERATION ON THE SCOTT MOTOR CYCLE FLYWHEEL.

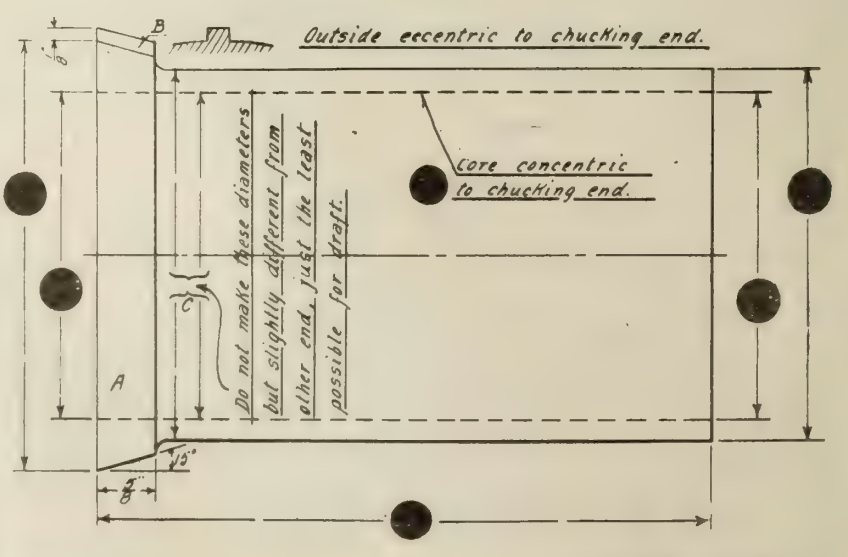
one which is equally powerful in gripping outward or inward.



The lay-out for the machining of this piece is shown at Fig. 10. No. 1 is a tool for rough facing the side, rough turning the exterior and boss. No. 2 illustrates the method of machining a bevelled face with a single point traversing cut. This is a case where it would be bad practice to bring a broad form tool on to the scale, and the method of profiling used in this case is one which is recommended for either straight or curved bevelled faces. The cutting tool is carried in a slide which can move parallel with the axis of the lathe, this slide being fixed in the square turret. At the right-hand end is a copy roller, which, when engaged with the cam on tool holder No. 3, causes the cutting tool to move in a patch governed by the former when the transverse feed is set into motion. In the slide there is a spring which acts in the same direction as the pressure of the cut and keeps the roller in contact with the former. No. 3 is a flat centering tool for starting the drill.

The boring bar holder in this case is special, as it is arranged to carry the former for profiling, since there is no vacant turret face. No. 4 is a twist drill; No. 5 a finish turning and facing tool for the side, the exterior and the spigot; No. 6 a chamfer form tool carried in the back tool post; No. 7 a counterboring tool for the recess in the boss. The depth of this has to be very accurate, and is therefore determined by a stop collar mounted on the tool itself, which comes up against the boss. In a case such as this it is a more accurate method of working than from the turret slide stops. No. 8 is a roughing taper reamer on which is mounted a cutter for forming the radius in the mouth of the counterbore. No. 9 is a finishing taper reamer which is also provided with a stop collar to ensure accurate plug depth. No. 10 is an adjustable knee-turning tool piloted and carrying sizing cutters for the spigot and the exterior. The object of sizing the exterior is to provide a convenient location for the second operation. While on the subject of turning to size it is important to note that when this is done from the turret it is good practice to have the cutter vertically over the work, so that any slight inaccuracy in the indexing of the turret does not materially affect the size produced.

The machining at the second operation is practically identical with the first, and the interest lies in the method of chucking, this being shown at Fig. 11. This special method of chucking is adopted to obtain the concentricity which has already been mentioned. Bolted to the chuck face is a special faceplate; this is hardened and the bore ground out perfectly true. At the first operation the outside diameter of the flywheel is made so that it is a nice sliding fit in the faceplate. The gripping and driving is done by soft jaws, which are admitted by three slots cut in the faceplate, but these jaws have no influence on the centering of the work, which is done entirely by the faceplate. Flywheels machined by this method face the concentricity test satisfactorily, and the production time is in the neighborhood of an hour apiece. In a later article we will consider some further lay-outs.

**Will Need Equipment.**—T. & N. O. shops at North Bay have completed plans for the remodelling of their machine shop and will be installing some new equipment.

# Machine Tool Builders New Accounting Plan

## Job Order Costs—Burden Distribution—Fixing the Burden Rate —Rate to Use—Separate Kinds of Business—Supplies, Small Tools, Repairs, and Depreciation

DURING the recent meeting of the Machine Tool Builders at Cleveland, Ohio, Mr. Scovell gave a report of an investigation by the Scovell-Wellington Co. This paper covered a very wide range, and although we cannot find space to print the material in its entirety, here are a few of the points brought out. As far back as December, 1920, this concern was instructed to hold a series of regional meetings. This was done in Chicago, Cincinnati, Cleveland, Worcester and New York, between Jan. 11 and Jan. 20, with the result that valuable information was secured, some of which follows. It is, of course, understood that we have picked out only the points that, in our estimation, will interest our readers.

### Job Order Costs

There is no doubt that good cost accounting for the machine tool industry requires the operation of what is known as a job-order cost system, that is, a system which shall show the cost of the jobs which are issued to the shop—material, direct labor and a proper amount of overhead or burden. According to the information collected from the questionnaires, a large majority of the machine tool builders are already handling material and labor in a reasonably satisfactory way, so that any discussion of better or more uniform methods of accounting in the industry will be concerned almost entirely with the development, distribution and application of overhead or burden.

### Burden Distribution

The chart, Fig. 1, shows in graphic form the approved plan of collecting costs, particularly in respect to burden. A study of the chart will show that the aim is to allocate to each department or operating center of the business all the charges which belong there, and which should therefore be absorbed in the normal work done in that department or operating center.

One feature of this burden distribution which may be new to some is the plan for adding a portion of the burden on to material as it goes into the work-in-process. This idea is indicated on the chart by the lines which run from rectangles 37 and 38 to rectangle 43, and a somewhat similar charge on the cost of finished stock, storage and shipping is indicated by the line running from rectangle 39 to Selling Expense, rectangle 56. It should be clearly understood that this is a burden charge on material used. There is no suggestion of increasing the value of the unused inventories. Furthermore, only one calculation is required for all the material used on the job during the month; so that although it is a desirable refinement in accounting, it adds nothing to amount to anything in the way of additional clerical work.

### Interest on Investment

After a thorough consideration of the matter, the executive committee has decided unanimously to recommend to the industry that interest on investment be included in calculating the cost of manufacture. Without this accounting device the overhead or burden of different departments, or of different machine tools, will not be correctly stated, particularly that large and costly tools will otherwise have an insufficient burden rate, as there will be nothing to measure the cost of tying up capital in such equipment in comparison with light and relatively inexpensive machines. There is everything to gain and nothing to lose by carrying interest on investment as a factor in the fixed charges, rectangles 20 to 29 inclusive, and taking it up as a credit, under miscellaneous income, rectangle 54.

As to details of this practice, it should be explained that interest will be reckoned on all the assets employed in manufacture—land, buildings, equipment and inventories. The immediate effect is to increase the burden of that work which is done with large and costly machines in comparison with that work which is done with a smaller capital investment. As the product will include this element of cost, the stated value of the inventory of finished and partly finished work will be, to that extent, increased; but a reserve for the amount of interest included may, if desired, be deducted from the inventory assets in stating the balance sheet at the end of the year. There is some additional incentive to do this if there is an increase in the actual volume of such inventory during the year.

It should be further noted that only by charging interest on investment can the cost accounting in plants that are wholly or in part rented be made uniform with plants that are wholly owned. What is more important in this industry, it is only when interest on investment is reckoned on the assets that are utilized in the business that correct costs can be figured on patterns made in the company's pattern shop in comparison with patterns bought outside, or castings produced in the company's own foundry in comparison with castings purchased from others. Considerations like this are very important in a plan for uniform cost accounting.

A similar situation arises in respect to an auxiliary department like a power house. When members buy power, they necessarily get into their costs all such fixed charges on the capital used, and certainly no one would think of making a comparison between the cost of power purchased and the cost of power generated on the premises without reckoning into the latter the fixed charges of every kind on the capital required as well as the current operating expenses.

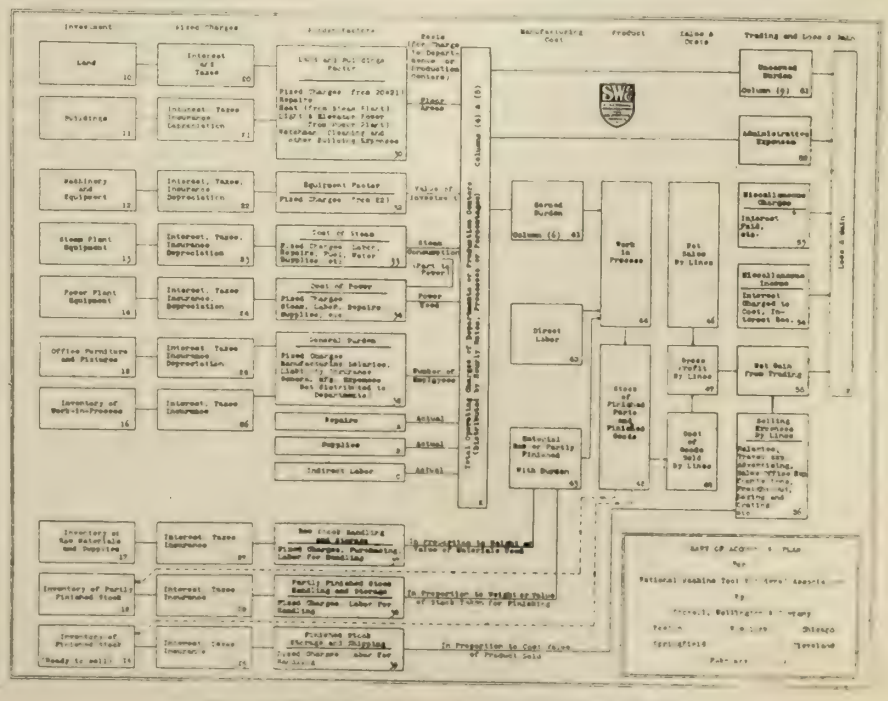

FIG. 1—CHART SHOWING ACCOUNTING PLAN.

Finally there is a marked disposition to reckon into costs interest on borrowed money, or interest on bonded debt; and whereas charges of this kind are incorrect in principle, and most objectionable in practice, they do reflect a sentiment which is well nigh universal in the business world that the use of capital is cost, which should be recognized before anything like a profit is calculated for the business.

**Fixing Burden Rate—The Normal Rate**

All of the overhead or burden of an operating department is represented by the long vertical bar, rectangle K, in the middle of the chart. This total, as the chart shows, is made up of (a) Land and Buildings Factor, rectangle 30, distributed to the several departments on the basis of the area occupied by each; (b) Equipment Factor, rectangle 32, apportioned according to the value of the equipment used in the several departments; (c) Steam and (d) Power costs, rectangles 33 and 34, distributed pro rata to the steam and power consumption; (e) General Burden, rectangle 35, distributed in proportion to the number of employees; and finally (f) Repairs, Supplies and Indirect Labor, rectangles A, B and C, charged to the several departments as actually incurred.

The idea of distributing or apportioning burden to "departments" or "production centers" is applicable particularly to the larger shops. For the small shop the idea is to develop or recognize all the burden that exists, and make plans to have it added to the cost of production as nearly as possible in accordance with the facts in that shop. In a very small shop, particularly if it is making only one product, there would be no serious inaccuracy in having one rate for the whole shop, or possibly two or three rates; but if there are varied working conditions, or if there is a great variety of product, distinctions must be made to get accurate costs.

A correct burden rate in any department will be determined by dividing the overhead or burden of the department by the normal number of operating units, that is, the normal man-hour or machine-hour capacity of the department or production center.

Great care should be taken to see that the calculation of a burden rate is made on the basis of operating units that can be realized with ordinary good management, if a shop has a steady volume of business, but not considering a night shift or overtime. It is not easy to say just what per cent. of the theoretical hours should be taken as the standard for the purpose of setting burden rates, but allowance should be made for those shut-downs of a department (or a particular tool) repairs, absent workmen, etc., which occur under normal conditions. At this point in the calculation no allowance should be made for shut-downs resulting from lack of orders.

All of the work done in the shop should uniformly carry the normal rate of burden, not more when the shop is partly idle, and not less when it is unusually busy. This arrangement gives costs which are comparable at all times and which vary only in proportion to operating efficiency. This idea of a normal rate of burden is fundamental to good cost accounting, and is particularly important in an industry subject to such ups and downs of production as the manufacture of machine tools.

According to this plan, when the shop is busy all of this burden will be "earned," as indicated by rectangle 41, and thus be carried into work-in-process, rectangle 44. When the shop is operating on part time, a corresponding portion of the burden will be unearned or unabsorbed, and will therefore go directly to loss and gain, as indicated by rectangle 51.

*POINTS BROUGHT OUT*

*That a proper job order system, showing the cost of the work, material, direct labor, and a proper amount of overhead is necessary.*

*That interest on investment should be included in calculating the cost of manufacture.*

*That the correct burden rate in any department can be determined by dividing the overhead by the normal number of operating units, that is, the normal man-hour or machine-hour capacity*

*That spoiled work should be handled in two ways. First—let the spoiled work all stand as part of the cost of the job, and to let the good pieces absorb this cost. Second—to subtract all the material, labor, and burden cost on the spoiled pieces from the cost of the job, and charge this total, less any salvage value of scrap as a factor of overhead.*

**What Kind of Rate to Use**

A rate-per-cent.-on-wage-cost as a method of distributing burden is acceptable only when the wages of all the operatives are very uniform, and when the facilities at their disposal are likewise uniform. As these conditions are rarely present in a machine shop, the rate-per-cent.-on-wage-cost is not a satisfactory method of distributing burden in this industry.

The use of a man-hour-rate removes the inequalities which arise by reason of varying earnings on the part of the operatives, and recognizes the fact that burden corresponds much more nearly to the number of people employed than it does to the wages which they earn.

Under some conditions the man-hour rate will be a satisfactory method of distributing shop burden, but generally the facilities with which the men work will vary so greatly that thoroughly accurate costs cannot be secured without the use of a machine-hour rate, which will be greater or less for different machines (a) according to their size, and therefore the space they occupy; (b) according to their value, and therefore the fixed charges which they should carry (interest, taxes, insurance and depreciation), and (c) according to the power which they use, and therefore the amount of power cost which should be included in the burden rate.

The comparison of actual hours with standard hours may be made a very important factor in securing economical administration. For many years past, shops with the strongest management have had daily operation reports, summarized at frequent and regular intervals, accounting for all idle time of their machines. Some of this idleness will be recognized as inevitable; but in order to fix the standard hours a record of this kind needs to be kept, and in order to reduce to a minimum the loss resulting from idleness, this record needs to have consistent executive attention. If this is done, the management frequently gets an important reflection of the efficiency of the various departments in advancing a job from one operation to the next, not to mention the efficiency of the purchasing agent, storekeeper, employment department or planning department who may have to do with material being on hand in the first place, or men being on hand and at the right time to take care of it. This is a very good example of the kind of analysis which, if correctly made and correctly used, puts money into the pocket of the management.

**Separate Kinds of Business**

Some members are engaged in other kinds of business in addition to the manufacture of machine tools, in which case the idea of a separate statement of gross profits applied to different lines (of machine tools) should be extended to apply with even greater emphasis to the different kinds of product manufactured. One member, for example, is making agricultural implements as well as machine tools, and several members are doing more or less business in the manufacture of automatic machinery parts.

Distinctions of this kind will be recognized and agreed to as soon as they are stated, and the same idea applies to the operation of a foundry or to a pattern shop if either one is run in connection with a machine shop; for many machine tool manufacturers get along without either of these departments. If a foundry is operated, the castings should be charged to the machine shop at a fair commercial price; so that the executives may know whether they are making or losing on the foundry, and so that the cost of the machine tools may not appear to be greater or less on that account.

**Spoiled Work**

Spoiled work will always be a subject on which there will be a considerable division of opinion as to how it should be treated. In general, the two plans for spoiled work are (1) to let it all stand as

part of the cost of the job which is being done, and to let the good pieces absorb all this cost; or (2) to subtract all the (a) material, (b) labor, and (c) burden cost on the spoiled pieces from the cost of the job, and charge this total, less any salvage value of scrap, as a factor of overhead or burden.

The first plan would properly be followed in an industry like drop forging or custom stamping, where the successive pieces are individual, and might have such peculiarities of design as would make more spoiled work in some cases than in others; for certainly it would be fair to treat any spoiled work which was a peculiarity of the pattern, in that way. In an industry where spoiled work is not a factor of design in any way, but merely reflects careless workmanship or other errors in the shop, and is, therefore, about as likely to occur on one piece as another, it is better to adopt the second plan and set up the net cost of spoiled work as a burden factor where it occurs.

In either case, the importance of spoiled work should be recognized, and spoiled work reports should be required showing all the particulars, including among other things the exact point at which the damage was done, if that can be determined, whatever details the management wants in the way of administration or discipline, and of course the cost of the spoilage.

The objection to letting the good pieces, however few they may be, take up all the cost of the work done on the job is that when this is done the factor of spoiled work is introduced into cost comparisons, so that if a part is made three or four times during the year, the comparison which is naturally desirable as to material, labor and burden cost on the part is to a considerable extent disturbed, and may be entirely destroyed, if the spoiled work factor is not eliminated.

### Drawings, Patterns, Jigs and Fixtures

During the discussion of the accounting practice to be recommended for the industry great emphasis was laid on the accounting for drawings, patterns and jigs and fixtures; and we understand that the executive committee is unanimous in recommending (a) that everything in the nature of repairs to restore worn or damaged pieces should in all cases be charged as an expense, (b) that the cost of new drawings, patterns and jigs and fixtures, not replacement, should be carefully separated from all other costs and (c) that these outlays should preferably be immediately charged as an expense in the year in which they occur; but under no circumstances should the expense be spread over a longer period than three years. The idea is to recognize these items unqualifiedly as an expense, and if they are not charged out currently as they occur, they should be considered like other deferred charges to operating.

### Supplies, Small Tools, Etc.

Considering miscellaneous shop expenses, it was thought desirable to emphasize the fact that such items as oil, waste, emery cloth, sand paper, emery wheels, paint brushes, oil cans, brooms, casehardening compound, hardening pots, hack saws, small drills, etc., should be treated as supplies and charged to expense as issued.

Perishable tools, including hammers, wrenches, screw drivers, chisels, reamers, larger drills, taps and dies, hobs, milling cutters, counter-borers, slitting saws, cut-off saws (both band and circular), broaches, and tools with a cutting point, etc., came in for a good deal of discussion. The best practice seems to be to charge these items to expense as issued, exactly like supplies; but many companies carry an asset for items of this kind intended to represent in a conservative way the investment which they have in such articles, and this asset should never be increased, except possibly in connection with a marked expansion of the business. Plans of inventorying perishable tools at regular intervals on a very conservative basis, or any systematic plan of depreciation at a high rate (50 per cent. was suggested) are acceptable, provided anybody feels that the plan of writing off the cost of these items as issued makes the charge to operating too uneven.

Belting was discussed at the same time with perishable tools, and it is recommended that charges for belting be handled on a plan in all respects similar to that recommended for perishable tools. Even where belting is given a steady care it should not be expected to have a life of more than four or five years; and if treated as an asset and subject to depreciation, a rate of 25 per cent. is recommended.

More permanent tools such as micrometers, calipers, test plugs, gauges, boring bars, vises, milling machine arbors, electric drills, pneumatic hammers, etc., may perhaps deserve a different treatment, but if set up as an asset should be depreciated so as to be written off over a period not to exceed three years.

Regarding supplies, perishable tools and permanent tools, it should be understood that these are to be set up as an asset when purchased, carried as an asset so long as they remain in the storeroom, but charged out to expense or otherwise when issued. This practice operates to distribute the cost of these items to correspond with the way they are put into use, and under most conditions will make a satisfactorily even spread of this item of expense.

### Repairs

Before considering the depreciation of other assets used in the machine tool industry, it should be understood that repairs of every kind are to be charged to expense as incurred. In this connection it may be well to note that whenever men are engaged on repair work, whether regular machinists, diverted to repairs instead of production work, or men from the regular repair crew, the charge for the repair work they do should include not only the wage rate of the men concerned but also an overhead or burden rate on a man-hour basis. Only when repairs are calculated at full cost in this way do the repair charges of the respective departments and production centers appear correctly; and as repairs are frequently an important factor in fixing a burden rate, it is highly desirable that they be stated correctly.

This idea of a full and correct statement of repairs is also important as applied to the costs of separate departments, like a foundry or pattern shop, which may exist in connection with some machine tool plants, but be entirely absent from others. It is also important in connection with an auxiliary department, like the boiler house or the power house, where repairs are likely to be heavy; or a storeroom, hospital or some other department which correct accounting requires should have its charges separately and fully stated, that the total may be distributed correctly over the departments served.

### Depreciation and Obsolescence

Proceeding from this general statement regarding repairs to a consideration of depreciation, the next point to consider is that depreciation rates may and should take into account obsolescence; that is, a charge in addition to wear and tear, in the expectation that the asset may not continue to serve its intended purpose until it is worn out, but (a) that it may be outgrown by the size of the business, or (b) by the need for moving to another location, or maybe (c) superseded by a design that is more economical and efficient, so that the business cannot afford to continue to use the original assets.

With this explanatory statement in regard to repairs, and the basis for calculating depreciation, the minimum rates recommended by the executive committee are as follows: Concrete buildings 2½ per cent., brick buildings (mill construction) 4 per cent., wooden buildings 6 per cent., machine tools 10 per cent., transmission (line shafting, hangers, pulleys) 15 per cent., electric motors 10 per cent., overhead travelling cranes 10 per cent., all other boiler house, power house, electrical, plumbing, heating, lighting and ventilating equipment 10 per cent., motor trucks—heavy 20 per cent, light 30 per cent., passenger cars 30 per cent., office furniture 15 per cent., office mechanical equipment 25 per cent., shop furniture, such as racks, bins, benches and trucks 25 per cent.

These rates are to be calculated upon the first cost of the asset, and set up annually in Reserve for Depreciation account. It is recognized that in the present deflating movement, assets may suffer marked declined value through price recession. Such a revaluation would have to be taken care of in a special way.

# Information Wanted on the Subject of Fits

IN July, 1920, the journal of Mechanical Engineering announced the organization and personnel of the Sectional Committee on Plain Limit Gages for General Engineering Work, a Sectional Committee which is working under the Rules of Procedure of the American Engineering Standards Committee and is sponsored by the American Society of Mechanical Engineers. After a preliminary canvass of the gaging situation carried on during the summer months, the committee subdivided itself into three working sub-committees. To these sub-committees have been assigned the three subdivisions of the subject, viz., (a) standards and tolerances for manufactured material; (b) methods of gaging manufactured material; and (c) gages and their limits, manufacture and use.

The Sub-Committee on Standards and Tolerances for Manufactured Material, to which has been assigned the task of preparing a set of standard allowances and tolerances for mating parts in interchangeable manufacture, has after considerable discussion and consultation with manufacturers prepared a questionnaire, full and complete, answers to which it earnestly requests. Since by the method of its organization the report of the full committee when approved by the A.E.S.C. will establish American standard practice, it is very desirable that everyone interested in any way in this set of standards should know of this activity and should have a part in it, if he so desires. Canadian Machinery therefore takes pleasure in reprinting this questionnaire in full and invites its readers to send their replies to our editor, who will in turn forward them to the committee. It is only by relating our experiences that we can help others.

For the purpose of clearness and after very careful consideration, the committee has subdivided all machined fits into four classes. These are listed below with the kinds of work which seem to fall in each class.

### Class No. 1—Loose Fits

Machined fits of agricultural, domestic and other machinery of similar grade (wagons excepted).

Mining machinery.

Controlling apparatus for marine work, etc.

Textile and rubber machinery, candy and bread machinery and others of similar grade.

Some parts of ordnance.

General machinery for manufacturing.

Question 1.—What allowances do you make in this class?

### Class No. 2—Medium Fits (Moving Parts)

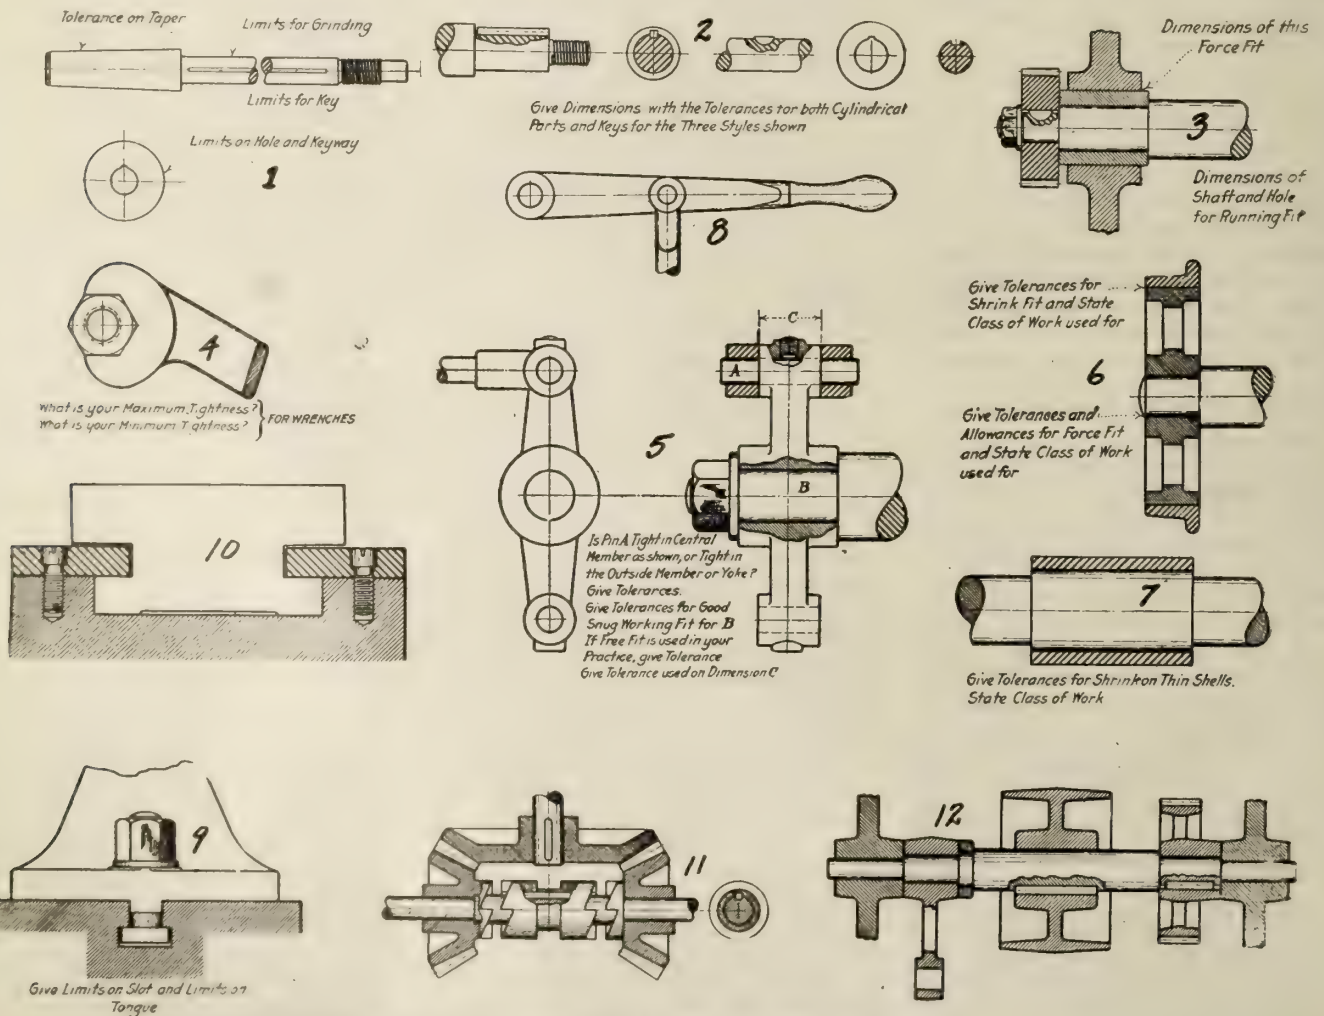
2a. High Speeds (over 600 r.p.m.) and Heavy Pressures.

Electrical machinery.

High-speed parts of woodworking machines.

Sewing machines.

Machine tools.



Locomotives.

Printing machinery.

Automotive.

Ordnance.

General machinery for manufacturing.

LET US HEAR FROM YOU REGARDING THE VARIOUS QUESTIONS ASKED.

A well-known firm uses allowances of 0.0005-0.004 inch up to 6 inches for work of this class.

Question 2.—How does this compare with your practice?

**Class No. 2—Medium Fits**

2b. Ordinary Speeds (under 600 r.p.m) and Light Pressures.
Machine tools.
Printing presses and machinery.
Typewriters, calculating machines, etc.
Locomotives.
Automotive—general parts.
Textiles, rubber machinery.
Ordnance.
General machinery for manufacturing.

A well-known firm uses allowance of 0.0005-0.0025 inch up to 6 inches for work of this class.

Question 3.—How does this compare with your practice?

**Class No. 3—Snug Fits**

(Designated as the closest fit that can be assembled by hand.)

3a. Slight Allowance (0.00025 to 0.00075 inch.)
Gear trains and change gears for general work.

Mating parts, fixed or not, moving on each other, such as studs for gears and levers, keys.

General machinery for manufacturing.

Question 4.—Do these allowances agree with your practice?

3b. Close Fit (commonly known as wringing fit, no allowance, not considered interchangeable manufacturing but selective assembling).

Crankshafts.

Precision-ground machine spindles.

Gears in index train of precision gear-cutting machines.

Slots and tongues such as are used for grinding machines, milling machines, etc.

Surveying and scientific dental instruments, etc.

General machinery for manufacturing.

Question 5.—Should no allowance be made in machining the fits in this class?

**Class No. 4—Tight Fits**

4a. Drive Fits for Light Sections.
Automotive.
Ordnance.
General machinery for manufacturing.

A well-known firm uses negative allowance from 0.00025 to 0.001 inch up to 6 inches.

Question 6.—How does this compare with your practice?

4b. Force Fits for Heavy Sections.
Locomotive and car wheels.
Crank discs, armatures, flywheels.
Automotive.
Ordnance.
General machinery for manufacturing.

A well-known firm uses negative allowance from 0.00075 to 0.005 inch up to 6 inches.

Question 7.—How does this compare with your practice?

4c. Shrink Fits.
Locomotive tires and similar work.
Ordnance.

A well-known concern's practice is as follows: Where thickness exceeds ⅜ inch, 0.0005 to 0.005 inch up to 6 inches diameter. Where thickness is less than ⅜ inch, up to 6 inches in diameter, 0.00025 inch to 0.0015 inch.

Question 8.—How does this practice compare with yours?

The committee would greatly appreciate having your full answers also to the three following general questions with as much explanatory information as possible:

Question 9.—How many of the four kinds of fits previously mentioned apply to your work?

Question 10.—Will you send the committee blueprints or other data showing your practice in as many of these cases as possible?

Question 11.—How do you specify both allowance and tolerance for mating parts—such as a solid 2-inch bearing and the shaft which runs into it?

The following sketches show some of the problems. Will you kindly give the committee as much information as possible regarding your practice in such cases.

Question 12.—What allowance and what tolerance would you give on such a piece as shown in Fig. 1: (a) for a milling-cutter arbor, (b) for a work-holding mandrel?

Question 13.—What allowance and what tolerance would you give on the keys and keyways shown in Fig. 2, where

(a) Keys are tight in both shaft and hub;

(b) Keys are tight in shaft—sliding in hub;

(c) Keys are tight in hub—sliding in shaft?

Question 14.—What difference in allowances and tolerances would you give on the bearing and gear fit shown in Fig. 3?

The fit of a wrench is shown in Fig. 4.

Question 15.—What is your practice as to allowance and tolerance for maximum looseness and maximum tightness?

The rocker arm shown in Fig. 5 contains several kinds of fits.

Question 16.—What allowance and tolerance would you give at A, B and C?

Two shrink fits are shown in Figs. 6 and 7, one a thin shell, the other a locomotive tire. The latter also has a press fit.

Question 17.—What is your practice on work of this or a similar character?

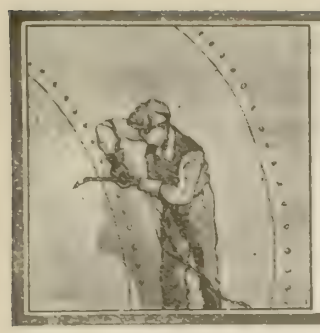
In multiplying movements the lost motion often plays an important part.

Question 18.—What is your practice in such cases as shown in Fig. 8—for both allowance and tolerance?

Fig. 9 shows a light sliding fit for accurate grinding or simialr work. Fig. 10 illustrates a working slide fit for turret slide or for similar purposes.

Question 19.—What are your allowances and tolerances in such cases?

Question 20.—Do they vary with the length of the slide?



The two remaining sketches, Figs. 11 and 12, show combinations which occur frequently in machine design.

Question 21.—Will you kindly give your practice in such cases?

Please bear in mind that this committee has no desire that its report shall impose arbitrary standards in any case. Its first work consists in securing data as to the best present practice in this country, with the sole aim of aiding interchangeable manufacture in every way possible. Your co-operation will aid greatly in reducing manufacturing costs in many places and in improving our already high standards of manufacture.

## PAINT FILLERS FOR CAST IRON WORK

Where castings have to be painted and varnished to give them a smooth and glossy finish, it is necessary to give one or more filling coats of thick paint made with some inert mineral and a drying oil medium such as a double-boiled linseed oil and turpentine plus the required driers for the quantity of oil used. Finely-ground slate or other soft and cheap mineral body answers very well, and gives a thick hard substance when dry, and one which will take the finishing paint well. Applied in a warm place, the first coat should be dry in a couple of days, when it should be rubbed level with glass paper and a second coat put on. When this is dry and hard it should have the surface rubbed smooth with fairly fine glass-paper, and after all dust has been carefully removed the finishing coat should be put on, for preference this being a hard-drying enamel paint which does not require varnishing. If, however, remarks Practical Engineer, an ordinary paint is used, it should be allowed to become thoroughly dry and hard, and then, after rubbing down with fine glass-paper, it should have a good coat of hard and tough copal varnish put on, this giving a glassy surface when dry and hard. All painting and varnishing should be done in a dry place free from dust, where the temperature can be kept at anywhere between 60 deg. and 75 deg. Fah., while proper time must be allowed for the work, it being very undesirable to apply paint or varnish until the preceding coat is thoroughly dry and fairly hard. All grease should be cleaned off metal before paint is put on, and where strong alkaline washes are used for this purpose the work should be rinsed off with an acidulated water to fully neutralize the alkali.

# WELDING AND CUTTING

## Oxy-Acetylene Welding of Iron and Steels

### Preparation of Parts--Selection of Blowpipe Tip—Preheating—Welding Rods and Flux—Execution of Welds, and Treatment After Welding

THE welding of iron and steels is at all times an interesting study. By iron and steels we mean commercial wrought iron, and mild or low carbon steel.

The operator will be able to work more intelligently if he knows something of the composition and nature of these metals. Iron, as a material of construction, is no longer used. Practically all of the so-called "wrought" iron on the market to-day is in reality a mild steel. For this reason wrought iron and mild steel metals are discussed as one. "Low carbon" or mild steel is quite ductile and malleable, but has a lower tensile strength and lower elastic limit than the "high carbon" or hard steels. No close distinction can be made between high and low carbon steel, but in general anything below 25 point carbon (0.25 per cent.) may be designated as mild steel, while those containing more than this amount are either half hard or hard. Most of the steels that the operator will be called upon to weld are mild.

#### Preparation of Parts

Mild steel parts are prepared in the manner described in February 24 issue. Several methods of preparing various parts to be welded are shown in the accompanying illustrations.

Fig 1 shows a section of one side of a steel cylinder and a convex head which is to be welded on. The weld should be made in the straight portion of the cylinder as shown, and not directly at the bend. Fig. 2 depicts the method of accomplishing the same result in the case of a concave end. If the parts are bevelled as shown, the joint will be a strong one.

Fig. 3 illustrates the proper method of preparing shafting up to two inches in diameter for welding. Note that this is bevelled to a chisel edge and not pointed. If the shaft is pointed (see Fig. 4), the molten metal will fall upon the cold part of the shaft and adhesion will result, which means that the new metal is merely "plastered" on at certain points and is not "fused."

Fig. 5 shows the proper method of bevelling a shaft over two inches in diameter. At the bottom of the bevel, the angle is large enough to insure a good weld. It is unnecessary to continue this wide angle clear to the top, however. The opening at the top should be approximately equal to the radius of the shaft.

In welding two plates it is necessary that the edges to be welded diverge as shown in Fig. 6. The amount of this divergence is dependent to some extent upon the thickness and nature of the metal. It is safe to say, however, that this divergence must not be over six per cent., nor less than 2½ per cent. of the length of the weld. Some operators stick by the hard and fast rule of ¼ inch

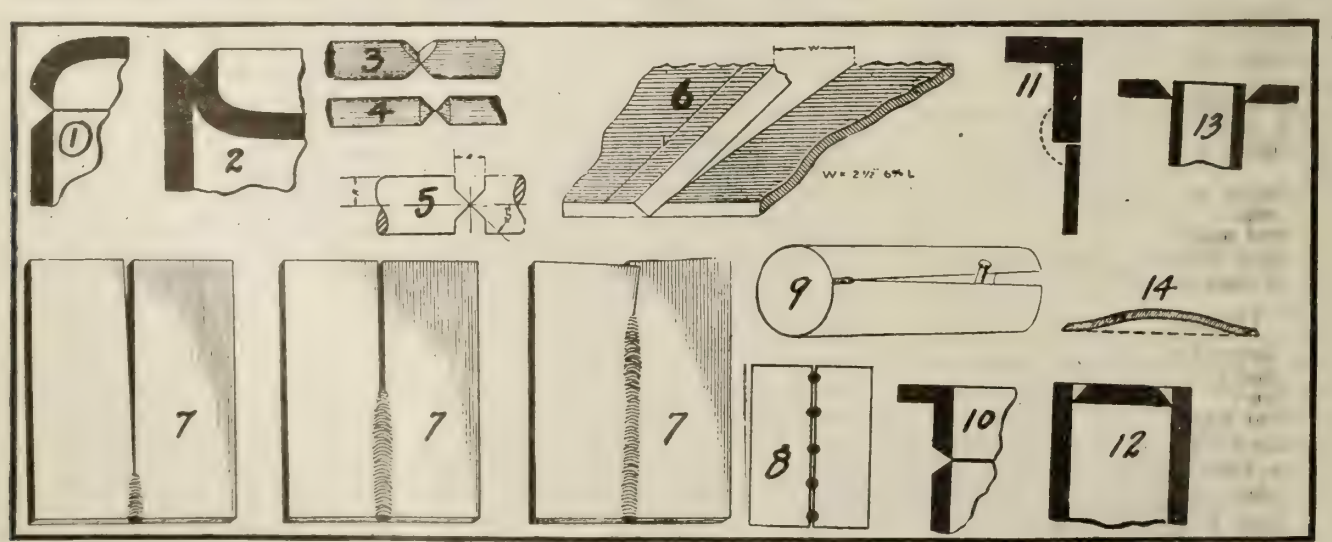


Fig. 1—Joint for convex end on cylinder. Fig. 2—Joint for concave end. Fig. 3—Correct method of preparing shaft for welding. Fig. 4—Incorrect method. Fig. 5—Method of beveling shaft over 2" diameter. Fig. 6—Sheets spread for welding to allow for draw. Fig. 7—Effects of not spreading sheets. First they spread, about the middle they close again, and beyond the middle they draw and lap.

Fig. 8.—Sheets tacked before welding. Fig. 9.—Wedge inserted between edges to prevent overlapping. Fig. 10—Joint for angle iron and sheet of the same thickness. Fig. 11—Joint for angle iron and thinner sheet. Fig. 12—Joint for flat end in tube. Fig. 13—Joint for flange in tube. Fig. 14—Patch plate bellied, and edges beveled.

per foot. This is a fairly good figure. Yet, to obtain the best results, certain deviations from this proportion should be made. In making a butt weld of two plates, the edges of which have been placed in contact with each other for their entire length, they diverge at first and then gradually come together until after about half of the weld has been made, when they will be parallel again. From this point on they will start to converge until there is an overlapping, as shown in Fig. 7.

There are two methods of overcoming this. First, by diverging the plates the proper amount. Second, by tacking or spot welding the joint at various points, Fig. 8. The second method has the disadvantage of causing warping or buckling under certain conditions. In a number of cases the warping or buckling can be eliminated by rolling or hammering after the piece has been welded. The first method is by far the most satisfactory, and after the welder has had practice he can accurately calculate the amount of divergence that the plates will need in order to bring the edges of the weld exactly together at its completion.

Another method of preventing overlapping of the plates, in the case of cylinders, is to insert a wedge a short distance ahead of the weld, moving the wedge as the weld progresses. This is shown in Fig. 9. When welding angle iron rings to cylinders where the thicknesses are the same, both edges should be set up as shown in Fig. 10. When the angle to be welded to the plate is thicker than the plate (Fig. 11) apply the flame more on the angle than on the plate. This will tend to bring the parts to the fusion point at the same time. Metal must be added as shown by the dotted line.

When welding a flat end into a tube, prepare the end as shown in Fig. 12, making a driving fit. The welding of flat flanges to tubes is an operation that requires care, as the flange is usually considerably thicker than the tube and has to stand a good deal of strain. The flange and tube are best prepared as shown in Fig. 13. The welding flame should play more on the flange than on the tube.

When repairing cracks in plates, always see that the crack is bevelled through its entire thickness. The plate being welded should be free to move. If it is impossible to provide for this, instead of attempting to repair the crack use a patch. A patch piece should always be slightly bellied and have edges bevelled as indicated in Fig. 14.

The size of tip to use for welding iron and steel depends upon the thickness of the metal, but do not forget that the flame should be neutral at all times.

### Preheating

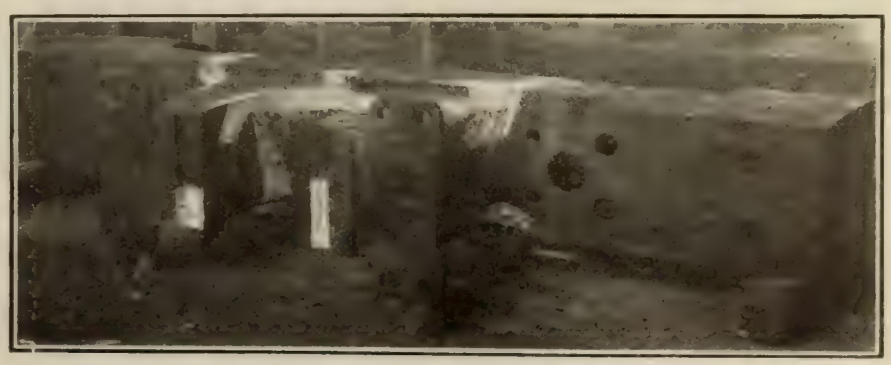
Preheating is usually unnecessary since iron and steel are elastic enough to take up expansion and contraction without breaking. However, in welding heavy sections, preheating will save 30 to 50 per cent. in gas consumption and labor, as the welds can be made faster on previously heated metal. For filling material in the case of work that is not under tension, use pure iron wire of the first quality to get the best results. This is free from slag, sulphur, phosphorus and other impurities. It should be remembered that pure iron has a comparatively low tensile strength. However, it is very ductile (elastic) and hence is very suitable for welding. Welding rods used on iron or steel should never exceed ⅜ inch in thickness. For thin work never use a rod thicker than the metal to be welded. The use of a flux is not necessary in welding wrought iron or steel. The general instructions already given apply in the welding of wrought iron and steel. The end of the small white cone should be allowed to just touch the metal.

Annealing or hammering, or both, will improve the quality of steel welds. Welds preferably should be treated in this manner wherever great strength is desired. The hammering should be done with the metal at a yellow white heat. Hammering at a dull red heat is likely to produce cracks or fissures in the welded portion. Before hammering, it is necessary to reheat the work thoroughly to the proper color. The welded part may then be annealed by heating to a cherry red heat and allowing to cool naturally.

### Special Steels

There are many special or alloy steels used in the metal industry. The operator is often called upon to weld these. Many automobile and locomotive parts are made from special alloy high carbon steels, and these castings or forgings undergo, during manufacture, special heat treatments which are in many cases more or less of a secret process. It will be appreciated that welding with a high temperature flame must necessarily counteract the effects that were produced by the heat treatment, consequently to make the part 100 per cent. efficient it is essential that after welding the piece be properly heat treated by an operator skilled in such work. The services of such a man are rarely available, therefore the results obtained when welding high carbon alloy steels will be uncertain. Fortunately, however, many of the alloy steels used in practice are not high carbon and can be welded satisfactorily. Manganese steel (low carbon) is welded quite readily. The manganese acts as a deoxidizing agent, that is, it counteracts the effect of burning the metal. If possible, use a filling material of the same composition as the part welded. If this cannot be obtained use pure iron.

Nickel steel (low carbon) can be welded without difficulty in exactly the same way as mild steel, but nickel steel welding rods must be used. Vanadium steel (low carbon) is probably the most commonly used steel alloy. Very fortunately it is extremely easy to weld, and flows much more readily than ordinary mild steel. Weld as mild steel, but use vanadium steel welding rods.



Chrome steel, if in the class of mild or low carbon steel, can be welded readily. Weld as mild steel. Use a nickel or vanadium steel welding rod. Many chrome steels, however, are in the high carbon or hard steel class and the general remarks on "special steels" apply.

*This information will be continued in later issues, and we will take up the subjects of irons and steels, pipe welding, cast iron, etc. We are indebted to the Oxweld Acetylene Co. for the use of this material.*—EDITOR.

## STEAM SHOVEL REPAIR

It is a well-known fact that a steam shovel is subjected to severe working stresses. For this reason, if for no other, the illustration and description should be of interest.

The end sill casting of one of these shovels gave way. It cracked in a dozen or more places and some of the pieces were small fragments that broke out and were lost. To replace the broken casting with a new one would have kept the equipment idle for several weeks. However, a new casting was out of the question, as the work had to proceed, so the cracked and broken casting was shipped to the Oxweld Setelyene Co., Newark, N.J., and was repaired, as shown, in short order. The saving in time alone is said to have replaced the repair expense.

VIEW SHOWING THE WORK COMPLETED.

# Have You Tried This Contest Yet? If not--- Do so Now

Below will be found twelve references to advertisements in this number. To the sender of the first correct set of answers to these we will forward one of these scales.
To win one is not difficult, and at the same time you will add to your store of knowledge. Read the details given below.

The scale is 6 in. long and is made from finest quality steel. One side is marked in 32nds, the other side in 64ths. A table of decimal equivalents is also stamped on one side, and a table of tap drill sizes on the reverse side. This scale is well worth securing.

## What You Have to Do

We publish every week a number of interesting facts or statements selected from the advertising pages for that week. The selections for this issue are given below. Read these through, then turn to the advertising section and see if you can pick out the advertisements to which they refer. The work is interesting, it will train your powers of perception and of memory, it costs you nothing, it will make you better acquainted with the various lines of machinery and tools in the market, and with perseverance you are bound to win one of these useful scales as a prize.

George Land, 567 Patterson St., Peterborough, Ont., is the prize-winner for March 3rd issue. All his answers were correct. Other readers came mighty close to a correct list—but—there was only one perfect list. This is the second scale George has landed, so it's up to the other contestants to dig in and show him he can't get them all.

**CONTEST FOR MARCH 24TH ISSUE**

**Contestants are required to write us, stating to which advertisements we refer in this number.**

1—Something which uses up double energy and which you are advised not to use.

2—Something of interest to gear users, that can be obtained free.

3—How to secure increased production, and minimum depreciation.

4—Something said to have exceptional fitness.

5—That it is possible to do two things at the same time.

6—Something you can procure without obligation.

7—How to make sure you are getting full value for every cent you spend.

8—Something that is always under air pressure.

9—Certain points in construction that are embodied as characteristics to a particular line of machine.

10—A product designed to give rapid accurate production.

11—Something that uses no electricity, and has perfect constancy.

12—A product that will operate against 100-lb. pressure.

**These are Correct Answers for List from March 3rd Issue:**

1—Northern Electric Co.

2—Hans Renold of Canada Ltd.

3—American Lead Pencil Co.

4—Nicholson File Co.

5—W. S. Rockwell Co.

6—Wisconsin Electric Co.

7—The Bristol Co.

8—S. F. Bowser Co., Ltd.

9—The Acme Machine Tool Co.

10—The Royal Bank of Canada.

11—Landis Machine Co.

12—The Burke Machine Tool Co.

## Closing Date for This Contest is April 14th.

# Proper Heat Treatment Means Quality Work

STEEL TREATERS and mechanical engineers of the Toronto district were given a distinct treat on the evening of March 18th, when G. W. Tall, Jr., of the Leeds & Northrup Co., Philadelphia, spoke on the Hump method of heat treatment. Mr. Tall proved a very very capable speaker, and brought out some valuable points to all interested in heat treatment of steels. His lecture was well illustrated, some 60 slides being shown, many of these covering intricate forms of dies that were treated by the Hump process.

As he so aptly put it, "Steel treatment is demanding and receiving more attention lately than at any time in our industrial life—and yet there is a great chance for improvement. The larger shops realize the advantage of using some proven method of heat treatment, but unfortunately many small shops have yet to be convinced. The initial cost is sometimes the stumbling-block, then again the excuse may be that the hardener is getting along well enough with his present system, which unfortunately is usually the guess and guess again method."

He blamed steel treaters themselves for a lot of their trouble. "Can you imagine a good toolmaker using some old broken-down lathe to produce first class work?" asked Mr. Tall. "Of course not, for he would tell his foreman it couldn't be done. Then again, give a toolmaker a pair of calipers and a micrometer, and a number of similar pieces to make. Will he get them as accurate with the calipers as he could by using the micrometer? Again the answer is no. Well then, how can a steel treater expect to get the best and most accurate results if he does not use proper equipment. The trouble lies chiefly in the fact that the steel treater in general belittles his calling by trying to use some makeshift apparatus, the result being that he has showers of abuse poured upon him on occasions when he is not at fault. Of course he has no excuse for he has no record to prove what he has been doing. Thus, he is continually in trouble, although indirectly he himself is responsible for that trouble."

To those readers who are not familiar with the Hump method of heat treating we append the following:—Briefly, this system gives unmistakable indications when the work has reached the critical or transformation point, this being used as a reference point for quenching. The system also insures uniform temperature at all points of the work. Distortion due to unequal expansion is practically eliminated, and spoiled work is almost unknown. It also gives accurate control of, and information regarding the rate of heating, and permits of a maximum rate of heating without injury to the work. A record of each work charge is made and preserved for future reference. In other words, guess work is eliminated, and scientific control substituted.

Heating is done by electric furnaces, and one advantage, as pointed out by Mr. Tall, is the fact that owing to low radiation externally, the heat treating equipment can be installed right in the manufacturing plant without discomfort to surrounding workers. This feature also eliminates extra trucking, and allows a better system of routing. The space occupied is comparatively small, this also being of considerable importance. Of course, there is no smoke or noise, as the electric system is both clean and noiseless.

The number of furnaces that can be handled by one man, varies according to the system installed. Usually one attendant can handle three furnaces, but if the volume of the work warrants it, a central station is aranged, and all furnaces, no mater what the quantity, are brought under the control of one man. He cannot make a mistake if he is a capable workman, for his charts tell him all he needs to know. The advantages of scientific control were, as the speaker pointed out, "High Quality, uniform and accurate results. Not only that, but the same results were duplicated every day for the preceding records were a guide, while on the other hand, the recording chart in connecting with each furnace guaranteed results."

**THINGS TO REMEMBER**

*Steel treaters are often responsible for their own trouble. The best of work cannot be secured with poor equipment.*

*Scientific control of the heat means high quality, uniformity, and accurate results.*

*That a good method to harden taps is by means of a special circular holder.*

*That the rate of expansion and contraction is very important.*

Some interesting examples of installations were shown on the screen, some of these being large automotive plants who used both the hardening and drawing furnaces, for gears, shafts, etc. To explain the system in its entirely would take considerable space, but we have arranged at a later date to present in full this method of heat treatment. The story which will be presented will be well illustrated with examples of work performed, and we shall show a sectional view of the furnace explaining the principal features of design.

After the lecture, the speaker was the target of a bombardment of questions. He was able to answer satisfactorily all queries however, and here are a few which are worth repeating.

In hardening files, a good method is to make special holders to accommodate a number of files at one time, quenching these in a vertical position.

In hardening taps and reamers, a good plan has been adopted. A circular form of pipe is arranged with a series of holes on the top, into which are placed the taps or reamers. In this position they are lowered into the furnace, also quenched.

A small outfit, that is for a small average shop would cost approximately $600, and larger equipment would run proportionately. This figure includes everything, even to service.

Large die blocks, up to the capacity of the furnace are handled with equal ease and with the same uniform results as pieces of light section. This statement was proved by a slide which showed the rate of expansion of the thick and thin sections of a piece being heated, and these rates were practically similar. In other words, there were no stresses conflicting in the piece, owing to one part expanding, while another was trying to contract.

In summing up his talk, Mr. Tall emphasized the need of education of employers as well as employees as to the value of proper heat treatment. Let steel treaters get together for the sake of the art and show the trade generally the benefits of scientific control of heating. Prove that uniform heating means better dies, which in turn means added production, and you've started the ball rolling in the right direction. Do not let the matter rest because the results you are obtaining seem splendid. Make sure they are the best you can secure. To prove the latter mentioned point, he quoted the story of one firm who were well satisfied with results obtained by ordinary methods, but since adopting the Hump method had increased the efficiency of their dies, not 100 per cent.—but 1,000 per cent. Naturally figures like these give us cause for thought, for after all we are all willing to invest our money if it is returned in such proportions as the above case.

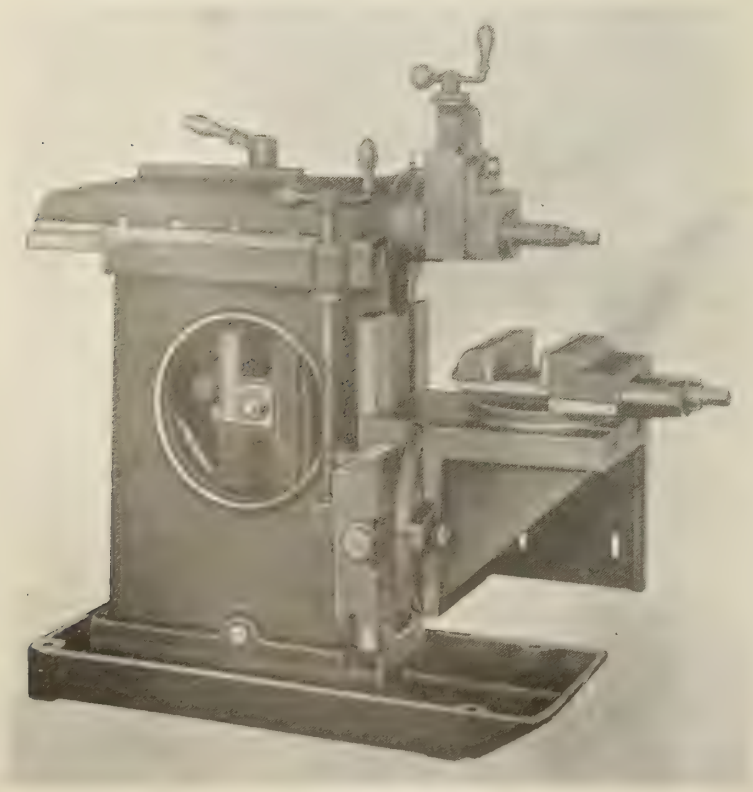
Fitzgerald & Kent, 232 King Street East, Hamilton, Ont., are contemplating the erection of a storehouse on Young Street.

# DEVELOPMENTS IN SHOP EQUIPMENT

## NINE-INCH SHAPER



Carl Pletz & Sons, Cincinnati, Ohio, have placed on the market a 9-inch shaper as illustrated.

This machine has been designed to meet the demand for a sturdy and accurate tool with the necessary range and extra features to handle the general run of shaper work in the tool room, die shop and experimental shop. Due to its sturdy construction, it also has its field as a manufacturing tool on small work and is said to be able to handle most of the work now being done on larger shapers with more speed and less power consumption.

The ram is heavily constructed with extra wide and long bearing surface. It can be set to any length stroke within its range. The graduated scale on the rocker arm shows the stroke at a glance. Bearings are fitted with felt oilers, insuring constant lubrication. The column is rigid, with an extra heavy wall of metal all around and is flanged out at the bottom where it bolts on the base. The ram-way is fitted with taper gib, adjustable for wear. The cross rail slides on a wide bearing on the column, is gibbed securely, with provisions made to take up the wear.

The swivel table is of the box section, bolted to the saddle with four bolts and swivels at any angle. It is graduated in degrees, the graduations being large enough to set at fraction of a degree. A dowel pin locates the table at zero. The automatic feed is in either direction and can be varied to suit.

The drive is by cone pulley, which runs on a sleeve taking the belt pull off the pinion shaft. Gears are accurately cut and the main bearing is bronze bushed with oil reservoir, insuring constant lubrication. The vise is heavily constructed with hardened steel jaws. The base is graduated and can be swiveled at any angle. Standard equipment includes universal table, two wrenches and countershaft. Pedestal can be furnished if desired.

GENERAL VIEW OF THE SHAPER.

## HEAVY DUTY LATHE

The Oliver Machinery Co., Grand Rapids, Mich., have placed on the market a 16-inch heavy duty lathe that is simplified to the greatest possible extent so that it can be used as a production lathe. A three-step cone is provided in the headstock, this being of large diameter, with each step wide in face. A large lever in front of headstock operates both starting and stopping of clutch.

The headstock can be supplied with single or double back gears, and four feeds to the lathe are obtained through a quick change gear box. The tool post on the carriage is also of very rugged design. Provision is made for a continuous flow of cutting compound, and the machine throughout is said to be of massive proportions.

---

## COLLAPSIBLE TAP

The Rickert-Shafer Co., 612 W. 12th St., Erie, Pa., has added to its line of threading machines and tools a new collapsible tap. The original and outstanding feature of this tool is the method of withdrawing the chasers when the work is tapped to the required depth. The manufacturers claim that the tap is "positive acting" and cannot stick. This is a decided advantage in all cases of tapping, but will be found especially useful where the work has to be tapped close to the bottom of the hole, as the chasers will be released at exactly the right point.

At the point of release the force of the cut pulls the head from the locking pins and revolves it. This action causes the cams on the core to act and pull the core back, drawing the chasers into the head and clearing them from the work. No dependence is placed upon springs for the purpose of collapsing. The method of making adjustments allows adjustments to be made to thousandths of an inch.

The company guarantees that these taps will hold to size within the most exacting limits, and that sizing hand taps can absolutely be dispensed with when this collapsing tap is used. These taps have hardened and ground wearing parts, accurate chasers, and are chip-proof. They are manufactured in sizes from 1 to 10 inches, or larger, and can also be specially combined with boring, reaming, or chamfering tools, thus greatly increasing production by eliminating additional operations and set-ups.

# NEW THINGS IN MACHINE TOOLS

### STRAIGHT-SIDE TRIMMING PRESS

The redesigned straight-side trimming press of the Williams, White & Company, of Moline, Ill., adds considerably to the efficiency of the machine. While primarily intended for the trimming operations on drop forgings, the large area of the table and ram face makes it particularly suitable for a large variety of stamping, drawing and other work. The gears are exceptionally large, made of steel and having cut teeth. The automatic-stop jaw clutch has six jaws and is 21 inches in diameter. The thrust end of the pitman operates in a bronze-lined steel thrust block. The press can be furnished either with a belt or motor drive. For the latter the motor is located on a special stand at the left of the machine. Variations from standard dimensions may be made when required.

### SPECIAL FURNACE WITH MOVING FLOOR

An automatic feed furnace, specially designed for heat treating purposes, has been constructed by the Advance Furnace and Engineering Company, of Springfield, Mass. The feeding device is operated intermittently, power being supplied at stated intervals either by hydraulic or pneumatic pressure. The movement of the floor is obtained through an electric timing device, and power is required only at the moment the movement is taking place. Furnaces may be made any desired length and the movement of the floor may be long or short as desired. The movement of the work is obtained by means of a horizontal and a vertical cylinder in conjunction with levers and other mechanism. The long rails that carry the work forward are below the level of the floor when in a neutral position. When movement takes place the rails are first elevated by means of a vertical cylinder, this raising the work from the floor of the furnace. When this is accomplished the horizontal cylinder comes into action and the work is moved forward a certain distance, and then lowered again, after which the rails are returned to their former position, until the time for the next movement. The timing device is operated by a small electric motor not more than ⅛ horsepower. The furnace may be adapted to the use of either gas or fuel oil.

### SHAFTING CLEANER

A specially designed ring for the cleaning of shafting has been placed on the market by the American Metal Products Company, of Chicago, Ill. The device consists of a number of duplicate pieces of heavy grade nickel-plated sheet zinc, in the form of quarter-circles, four duplicate pieces being used in the construction of each ring, the joints being placed 90 degrees apart, the sections being joined together by means of special staples made of the same material. The cleaners can be placed on shafting already installed, and may be easily removed. A pocket is provided on the inner circumference that is filled with felt that assists in distributing any oil on the shaft.

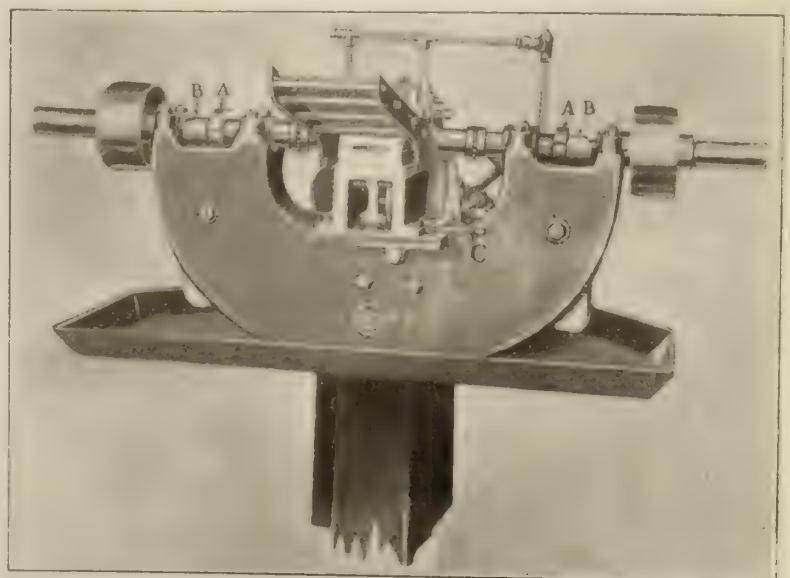
### BABBITT-LINING MACHINE

A special machine for the lining of bronze bushings with babbitt has been placed on the market by the Ideal Tool and Manufacturing Company, of Chicago, Ill. The machine is particularly adapted for use on automobile crank cases and electric motor bearings. A feature of the design is the rapid rotation of the bearing while the metal is cooling, the speed of the spindle being about 1,800 r.p.m. The machine has an approximate capacity of 700 bearings per day. The centrifugal action is said to counteract the contracting action of the metal. The machine is of the triplex type, so that ample time is allowed for cooling each bearing while the operator is charging the others. The machine is fitted with S.K.F. ball bearings, and chuck may be provided to suit the bearing being babbitted. Each spindle is independently operated.

### CHAMFERING AND THREADING MACHINES

The Grant Mfg. & Machine Co., of Bridgeport, Conn., have recently added to their line of double spindle automatic chamfering and threading machines, type No. 183, as shown in the following illustrations. The illustration depicts the front of machine, showing the cutter spindles, magazine, work holding and feeding table, etc. The spindle bushings have a lateral adjustment of approximately 2 in., by means of hardened collars shown at A, and are fed to the work by fulcrum levers B, operated by face cams within the body of the machine. The automatic movements are controlled by the lever C.

An oil tank and gear driven pump is provided which feeds suitable cutting lubricant to the tools through pipes shown.



With slight modification the above machine, which is shown equipped for double end chamfering, can be readily adapted for threading both ends of small rods automatically. It can also be equipped with tools to drill and counterbore or countersink both ends at one time.

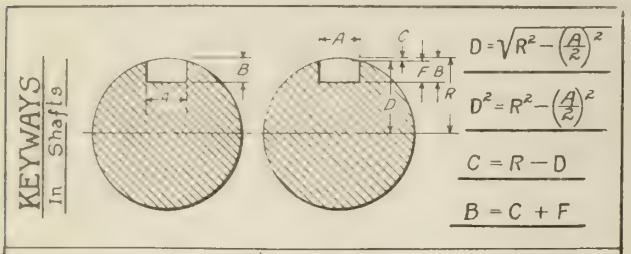
Ordinarily the work is placed in the inclined hopper or magazine shown, where it is fed by a slide mechanism to the proper machining position. There it is clamped and rigidly held while the work is being done. The finished pieces are then automatically ejected.

The hopper or magazine and feeding mechanism may be modified to suit various kinds of work, such as square, hexagon or other irregular shapes where an operation is to be done on both ends.

### ROTARY EMBOSSING MACHINE

Julius Merey, 2842 N. Maplewood Ave., Chicago, Ill., has placed on the market a special machine for the embossing of sheet metal, either in the flat or when formed into cylindrical shape. The machine consists of two heads mounted upon a horizontal bed, one of the heads carrying the embossing rolls and the other head used for the holding of the articles to be embossed. The rolls or the dies are made interchangeable, and the gearing is so constructed that the dies are automatically separated at the completion of the revolution. Provision is made for chucking different sizes of work; the chuck is rotated by means of power derived from the embossing head

GENERAL VIEW OF CHAMFERING AND THREADING MACHINE.



# WHAT OUR READERS THINK AND DO

## HANDY TABLE FOR CUTTING KEYWAYS

By R. MAWSON

The difference of opinion that many mechanics have in regard to the measurements of keyways in shafts and pulleys is the reason for the compilation of the accompanying table. A specific case of inconvenience was brought to our attention just recently. We were called upon to construct a certain machine, but owing to the pressure of business we were forced to have a large part of the machining done in outside shops, the various parts coming back to the factory for final assembly. On the drawing the designers, following the usual practice, had specified the keyways as follows: ⅜ inch by 3-16 inch, for example. The outside shops interpreted

PRESERVE THESE TABLES, AS THEY WILL PROVE A READY REFERENCE WELL WORTH WHILE.

this in various ways, some measuring the depth from the corner of the keyway, others from the center of the shaft, and still others taking a mean dimension between these two points.

The correct way is to machine the keyway slightly deeper than the section projecting above the shaft. The key will then fit on the sides and thus drive more efficiently. If the key fits tightly on the top there is the danger of straining, or even breaking, the hub of the wheel or pulley. The type of key referred to here is the square or rectangular one. One of the tables gives the dimensions for shaft keyways, and the other for hubs of gears, pulleys, etc. The table for shafts gives the sizes of shafts from ⅜ inch to 4 inches, varying by eighths of an inch. If it is desired to find the dimension for a shaft not specified the formulae given at the top will be found very convenient. The radial clearance to insure side fitting is given as .001 to .006 of an inch; this relief we have found to be very satisfactory.

# Lathe Work—John Receives Some Pointers

*By J. Davies*

"WELL, John, are you having any interesting experiences in your lathe work at the shop?"

"Yes, father, I certainly am. The other day I had a gear to bore out a driving fit for a shaft on the foundry crane. I couldn't try it on without taking the gear out of the chuck, and we didn't have any plug and ring to fit the gear and the shaft, so I was left to my own resources. I remembered you had told me 'that a plug and ring gauge would have to fit each other loose to make a tight fit between a shaft and a wheel,' and I knew that all our plug and ring gauges would not pass over each other, so they would have been of no use anyhow. I went after the foreman for a little information on the subject and here is what he told me:

"To be able to correctly turn a shaft the right size for a working or running fit, or bore out a wheel or bush a running fit, or bore out a wheel or bush a running fit with the aid of calipers only, depends entirely upon the skill and judgment of the workman. Generally speaking, the swing of the calipers should be about ¾ in. to the foot.

"The allowance for driving fits depends upon a number of circumstances such as the length of the hole. In a long hole there is more bearing surface than in a short one, consequently the outside diameter of the driven piece can be made a little less. The diameter of the work, the smoothness of the surface, the nature of the metal, and the thickness to resist bursting must all be taken into consideration, so that it is impossible to lay down a definite rule. It is in this class of work that experience counts. Generally speaking, if the hole and the shaft are made exactly the same size up to about six inches you will have a pretty snug driving fit. Always oil the surfaces, as it may happen that the fit is a little too tight and if you want to take it out to ease it a little after you have been driving two dry surfaces together it may give you a lot of trouble.

### Allowance For Fits

"The allowance for forced fits is a little more than for driving fits, the main points to take into consideration being the same as those mentioned for driving fits. One firm of engine builders allow for forcing on crank pins one-quarter of a thousandth for every inch in diameter up to eight inches.

"In fitting car wheels and axles it is generally specified that they shall go together with a certain pressure from twenty to thirty tons. Most firms specify exactly the amount to be allowed on their particular class of work. A twenty to thirty ton fit on a wheel and axle requires an allowance of about .008 in.

"In calipering shafts or axles the amount of difference is not always measured, a snap or limit gauge being sometimes used, or the calipers may be set; the insides to the exact size of the hole, and the outsides to the exact size of the insides. Then, by letting the outside drag over the work a fairly accurate estimate can be made of the force required to make the fit according to the length of the drag on the outsides. To find the amount in thousandths of the swing, or drag of a pair of calipers the following rule is often used:

"Let A in Fig. 1 equal side play of calipers or end measuring rod in sixteenths of an inch. B equal dimensions to which calipers are set, or length of measuring rod in inches. C equals difference between diameter of hole and length of B in thousandths of an inch.

Then C equals $\frac{A^2}{2B}$ within a very small limit.

For example, a standard rod 5½ in. long has ⅜ in. side play, what is the size of the hole?

$$C = \frac{6 \times 6}{11} = 3.27 \text{ thousandths or } .00327 \text{ in.}$$

"This method will be found to be correct within a limit of about .002 inch if the amount of side play is not more than one-eighth of the diameter of the hole. For holes up to six inches in diameter: with 0.0005 in. for holes from six inches up to twelve inches; and within 0.001 in. for holes from 12 inches to 24 inches.

"A shrink fit refers to the method of putting two pieces together, usually by heating the metal around the hole, thereby causing it to expand; then putting the piece that has to be shrunk on to it through the hole, allowing it to cool and contract on the axle, or shaft, or what-

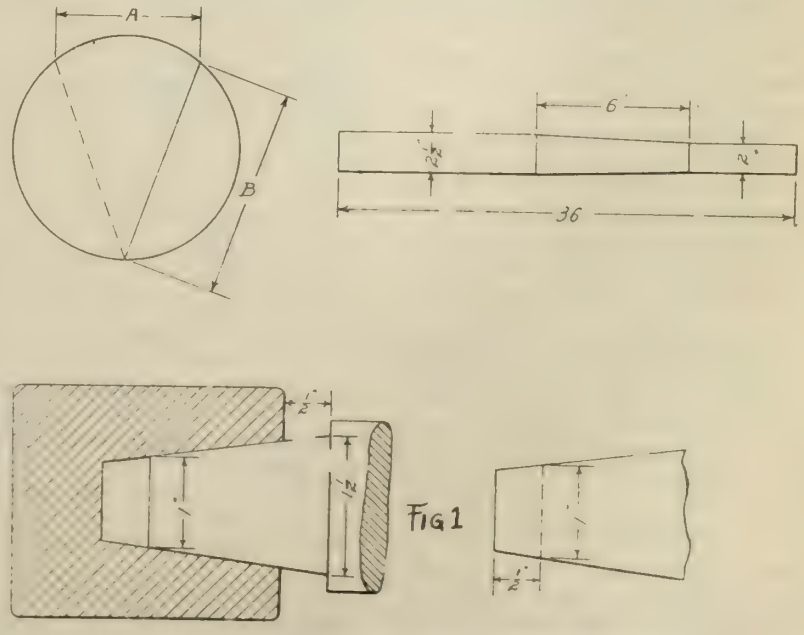

FIG 1

REFER TO TEXT FOR DESCRIPTION OF VIEWS SHOWN.

ever it may be. A good rule is to allow .003 inch for the first inch and 1½ in. thousandths more for every inch up to 20 in. diameter.

"The amount of shrinkage for locomotive tires adopted by the American Railroad Master Mechanics' Association is as follows: 38 hole amount of allowance, .040 in.; 50 hole, .053 in.; 56 hole, .060 in.; 62 hole, .066 in.; 66 hole, .070 in.

"Speaking of good fits reminds me of a story I heard the other day of a machinist who was sent to an outside repair job. The job was turning a new piston for an engine in a small factory. He was sent to the factory to measure up the cylinder, then it was his duty to turn up the piston to fit.

"The piston was duly finished and delivered, but it was found to be impossible to get it into the cylinder. Complaint was made to the shop and the machinist in question was asked to give an account of his workmanship. He asked the engineer who had charge of putting the engine together if he had oiled the cylinder. The engineer replied, 'Yes, I thoroughly cleaned and oiled the cylinder.'

"'Oh,' replied the machinist, 'that accounts for it. That's why the piston wouldn't go into the cylinder. I didn't allow for oil.'

"Of course, that is only a joke, but this actually happened. In a machine shop near Toronto during the war they were making 18 pound shrapnel shells, and when they first started out they used aluminum gauges, that is, aluminum bodies with hardened steel tips. Later on the aluminum bodies were discarded and cast iron used instead. It was found that the cast iron did not spring as much as the aluminum, and one day a shell operator, engaged in turning bodies, came into the tool room with a cast iron gauge in his hand. He threw it on the bench and said he wasn't going to use that thing, as it was no good. The tool maker asked, 'What's the matter with it?'

"'Matter with it,' replied the workman, 'why there is no spring to it; I can't shove it over the job.'

"You see, his trouble was that he had no idea of the sense of touch. If you get the inside and outside micrometers and leave the hole about .002 smaller than the shaft it will be a pretty tight fit."

The next job John had was to turn a shaft partly parallel, and partly taper, and as he had no experience in taper turning he promptly consulted the lathe hand next to him, who happened to be an experienced old veteran. This is what John was told:

### Turning Tapers

"There are at least three different ways of turning taper work between the centres of a lathe. Each method has its advantages and disadvantages, while to a great extent the choice of one or the other of the methods depends upon the work in hand. The first method is by setting the tail stock spindle or dead centre out of line with the live centre. There are usually graduations on the back of the tailstock with a zero mark indicating when the lathe is cutting parallel. If there are no graduations, make one with a fine chisel, then the amount that the tailstock is set over can be measured with a scale.

"In order to use this method it is necessary to figure out the amount of taper per ft., or per inch, whichever is the most convenient. Compare this with the length of the job, or else assume that the work is one continuous taper from end to end. Suppose, for example, we had to turn a taper according to sketch shown.

"In this case the taper is ½ in. in six inches, or 1 inch per ft., but the total length of the job is three feet. This means that there would be three inches of taper in the complete piece. In other words we would have to set the tailstock over 1½ inches, which is half the amount, because, when the tool cuts into the work, say ¼ in., it makes the job ½ in. less in diameter. Setting over the tailstock is most convenient when the job is a long one and the taper is slight.

"The objection to setting over the tailstock, however, is this, that the centres are not in line, therefore they wear unequal and uneven, and the part to be tapered is very apt not to run true with the part that is parallel. If a number of pieces of different lengths were to be turned the same taper the lathe would have to be reset for each piece; and even if they were the same length if the centers were not all drilled to the same depth it would make an appreciable difference. Another way in which the lathe may be set for turning tapers is to turn a small portion at one end of the taper to the small size, and another portion at the other end of the taper to the large size. Then run the tool backward and forward between the narrow strips that are turned and adjust the center until the tool exactly touches both ends.

"This method is equally adaptable for setting over the tailstock or the compound rest. Tapers can be turned by hand by swinging round the top slide of the compound rest. This is the best method for short, abrupt tapers, and it would greatly facilitate matters for the lathe hand if draughtsmen would give tapers in degrees and state amount per ft. in addition to giving the dimensions, as the lathe hand could then put his rest round to the degrees indicated on the drawing. A table of tapers and angles will be found useful in connection with lathe work, and these can be found in almost every machinist text book.

"No matter what method is used it is important to set the tool exactly level with the centre, and this can be done quite readily by using the mark on the tailstock. If the tool is set on the centre of the work and a cut taken, then the tool removed and not put back at the same height, the taper of the work will be altered. Should we put the tool either too high or too low it will take too much off the large end.

"This fact can sometimes be used to advantage. The work in hand might be slightly big at the large end, so, instead of moving the taper attachment, merely raise the tool a little.

"After roughing a tapered piece it should be tried in the place it is intended to fix, taking care to leave it sufficiently above the size to allow for fitting. If one end is much too small it can be detected by rocking the work in the hole. After fitting till there is no perceptible play in the hole, give it a turn round by hand. The marks will be rubbed off the high spots and the taper should be adjusted until these marks show a full bearing along the surface of the taper. After fitting satisfactorily, measure how much further the taper needs to go into the hole to be in its correct place. Suppose Fig. 1 is fitted correctly, but requires to go in ½ in. further to be in its correct place. Measure with calipers very carefully the diameter of the taper at the small end of the shaft, then take a fine cut and test with the calipers until the work is the same size as the calipers ½ in. from the end. By this means, after getting the taper a good fit, you can make it the correct size at the next trial. It is better to err a little on the full size, as you can then give it a rub or two with a file, but if too small there is no remedy."

## PALM OIL AS A FUEL

The world's supply of mineral oil is limited. At least, so say geologists, so that the experiments with vegetable oil as a motor fuel should be of decided interest. The oil used in these experiments has been palm oil, well known in the commercial markets as one of the most desirable ingredients of the nut-margarines. The tests have been carried on in Brussels, with a view of making use of palm oil, if practicable, as a motor fuel in the Kongo. The difficulty of transporting mineral oil to the Kongo, and its high cost when delivered —about $1.40 per gallon—made the finding of a substitute a great desideratum. And, as palm oil was one of the products of the Kongo, and could be had there for about 20 cents a gallon, the reward for its successful adaptation was alluring.

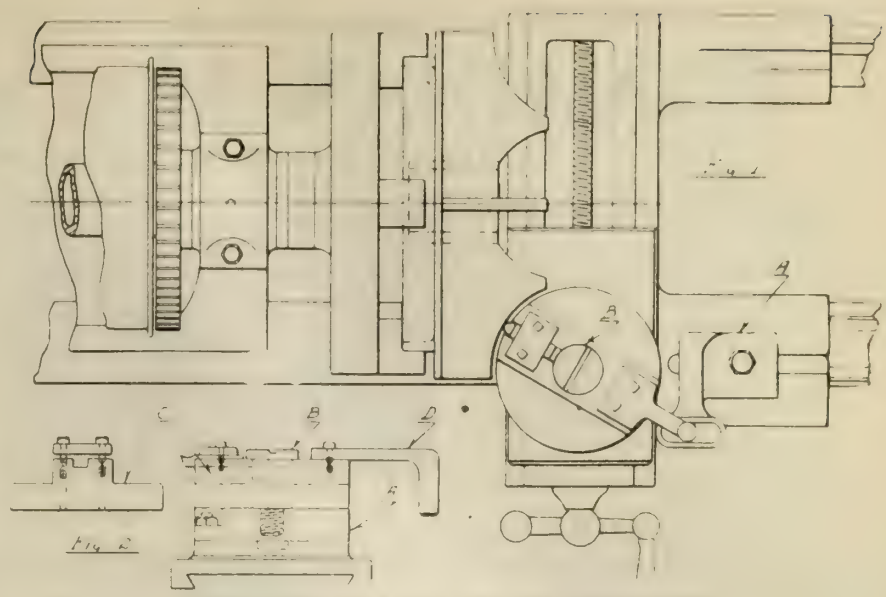
The calorific value of palm oil varies from 75 to 80 per cent. of that of mineral oil; therefore, from one-fourth to one-third more must be burned to get the same power.

The experiments have proved that palm oil will work perfectly in a certain form of motor of a semi-Diesel type without any change, in the ordinary Kongo temperatures. In Belgium, how-

ever, where the winter temperatures are below the solidifying point of palm oil, an accessory is necessary to liquefy the oil. Further, in Belgian winter temperatures it has been advisable to start the motor with petroleum, and when it is well warmed up to substitute the palm oil.

The experiments have shown that palm oil burns completely, leaving no residue. So far the trials have been made chiefly on motor boats, but they are being extended to tractors and industrial motors. In July, 1920, the Belgian Ministry of Colonies initiated a prize contest for tractors operated on any of the vegetable oils produced in the Kongo. Only one contestant appeared—an evidence of the lack of research along this line.

With the passing of petroleum, an eventuality already being discounted by the geologists, the practically unlimited production of vegetable motor oils may easily become one of the important industries of the near future.



## RADIUS TURNING ATTACHMENT

By G. Barrett

The accompanying sketch illustrates a radius turning attachment for use on a lathe, and may be adapted for a wide range of work. Fig. 1 shows a plain view of the device, set up to turn the radius on an impeller, this operation requiring considerable accuracy to provide the suction required. The attachment consists of a swivel casting A, Fig. 2, turned to fit the lower portion of the cross slide of the lathe. This casting is secured by bolts in the usual manner, and the top surface carries a revolving tool block C, held in position by the central bolt B. The link D is securely fastened to the upper face of the tool block, a tongue being provided to prevent shifting. The pin portion of the link D fits into the elongated slot in the bracket A, which is bolted to the carriage of the lathe.

When the cutting tool is set, and the link and bracket in position, the movement of the cross slide will cause the tool block to revolve and the tool point will cut the desired radius on the work. It should be mentioned that the tool point should be set at the horizontal lathe centre, otherwise the result will not be a true radius. This attachment has the advantage of being self-contained, and once set will produce uniform work without the use of a cam, weight or springs, and is very simple to operate.

More than 5,000 men employed by the Canadian Pacific Railway will be taking a compulsory holiday from March 23 to April 4, owing to the closing down of the Angus shops in Montreal. This is being done because the work has been caught up, thus affording a method of reducing expenses.

DETAILS OF THE RADIUS TURNING ATTACHMENT.

## LEAD AND SHEET IRON

A reinforcement of lead with perforated iron sheet has been found to increase the elastic limit four to five-fold, and the tensile strength from two to three-fold, the variations being due to differences in gauge of wire and mesh used. Lateral extensions of 20 per cent. and elongation of 20 per cent. have been obtained. Sheets 4 ft. 6 in. by 5 ft. 6in. have been made. These reinforced sheets may be bent or shaped almost at will, as the lead does not fracture when bent. The sheets may be cut and joints burned together as in ordinary sheet lead. A pipe, 8 inches in diameter, made up of reinforced lead 0.2 inches thick, when tested for strength, collapsed under a pressure of 85 lbs. per square inch.

## Stocks Are Running Low

BUYERS may wake up some day to find out they have stayed out of the market too long.

When people cease to buy, or when they cut their purchases to the bone, and then trim the bones down, they must know that manufacturers are going to ease off in their schedule of production. It is poor business to stack up great heaps of material against the day when the buyers may flock back again to the markets.

The buyers of steel and iron have been taking on just as little as they could stand. For some time this has been true all through, including warehouses and manufacturing interests. They have thought of hardly any other thing except liquidation of stock.

The result is that stocks are getting low, in some lines so low that certain yards are out and have to send their orders direct to the mills.

There is every prospect of a railway strike in the United States. The one last year is still fresh in the minds of the people. There were Canadian industrial concerns spending thousands of dollars in order to get supplies of raw and semi-finished material through.

Is it not worth considering what will happen if there is another strike, with stocks getting well thinned out in many lines in Canada? How long, under such circumstances, would prices remain at present levels?

## Making Use of The Time

GOING through a period such as the present, it is very easy for a salesman to sit back and wait for things to turn better. He has not closed much business, and perhaps believes that when the corner is turned things are going to come better.

Here is another way—not imaginary, but real. It is the experience of a practical man who knows how to sell machine tools on their merits, and who understands the various operations that his machine tools are put in to perform.

He finds that right now is a splendid time to do effective missionary work for his firm. The superintendent in most cases is not very busy. It is possible also to get to the executives higher up for the same reason. Were things humming around the plant he could not get as much time from the prospects to lay his proposals before them. There are many fine points that would never be brought out, and many prejudices that would be allowed to ride because there had been no opportunity to meet them and correct them.

It works both ways. The average superintendent or purchasing agent is anxious to be well informed. If a salesman goes to him prepared to impart real information on any given subject of interest, he is going to give him a hearing.

The plant executive, if he is a real one, will be open to suggestions concerning the improving of any operation carried on in his plant. He should count it a good day's work in this rather dull season if he can bring out one good idea that will make for better and more efficient production methods when operations start at full blast again.

## Standardization Up Again

STANDARDIZING farm implements was brought up in the Dominion House a few days ago. Those who urge this might be well advised to go to some good shop superintendent, or designer, and talk the whole thing over. Once they were possessed of all the facts they would see where their very good intentions were quite impracticable and equally undesirable.

Speaking of this move, George Wedlake, manager of the Cockshutt Plow Co., states that "nothing could be gained by it, as it is not practical. It has been brought before implement manufacturers at other times, and it has been decided that there was nothing for the customer to gain by it." Mr. Wedlake also believes that beyond the standardizing of nuts and bolts and the use of standard plows, no more progress can be made.

Implement makers do not change designs simply for the sake of piling up various designs. They do not change patterns unless they see a very decided advantage, for every change in design means added expense, and the only chance to recover is in the selling power coming from the added quality put into the machine.

Standardization is not desirable from another point of view. It smells musty and smacks of smug contentment with present accomplishments.

If implement makers had standardized on the old reaper we would not to-day have the self-binder.

If we had standardized on coal oil lamps we would not be using electricity.

If we had standardized on certain faces of type and a Washington press, we would not have our linotype and rotary presses of to-day.

If the navigators of old had standardized on certain types of sailing vessels, we would not to-day be crossing the Atlantic in a day or so under a week.

Standardization is not going to solve the problem of the use of our own iron ores. It is going to be done by research, by persistent hard work, by reaching out after things we have not yet attained, but never by thinking that what we have is the last word in design and practice and therefore not open to improvement or alteration.

This question apparently has to have its little fling in the Dominion House every year. It is just another case of a member of the House trying to make himself strong with his constituents by talking about matters on which his technical knowledge is limited.

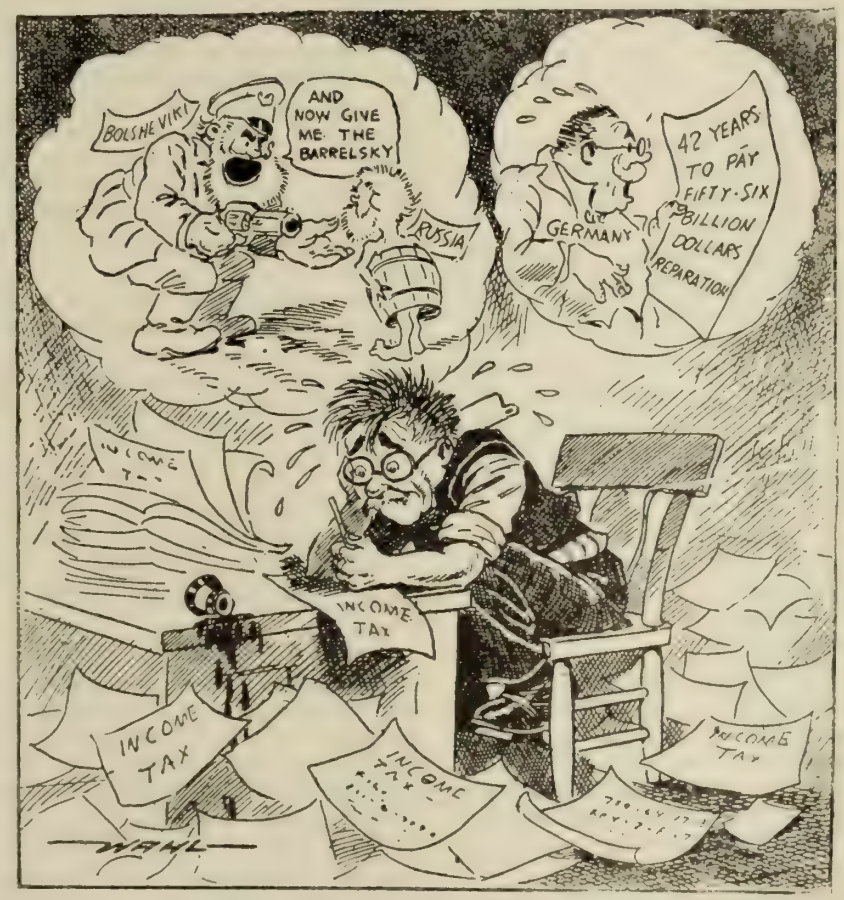
# *Shall Canada Trade With Germany?*

ON WHAT grounds shall Canadian firms go ahead and re-establish trading conditions with Germany?

Canadian Machinery readers are evidently very much interested in this matter, knowing as they do that each week sees more evidence of the coming of the German-made article. Their catalogues also are coming in increasing numbers, and although there may be a disposition at first hand to drop them over into the waste-paper basket, many of them are being read and studied.

**Not After German Business**

P. Ford-Smith, president and general manager of the Ford-Smith Machine Co., Hamilton, cannot bring himself to welcome German trade with open arms. The war days and the memories of German war methods have not been blotted out as far as he is concerned. Mr. Ford-Smith says:



"We appreciate that if the Allies are to collect a huge war indemnity from Germany they will have to be allowed to do business. However, as far as this firm is concerned we will not trade with Germany, either by buying or selling to that country. It is probably nearly a year ago now that we were offered German small tools and machine tools, and we wrote to the firm, replying to their letter, and told them that we would not consider any business relations whatever with them, that we had no desire to meet or to deal with any German people. As a matter of fact, we told them to go to h—.

"I do not say that this should be the attitude for everybody to adopt, because no doubt there are certain things that Germany can make that we cannot make, and that she may have a genius for, and it would be ridiculous not to take advantage of this. But in the main, where goods can be purchased either in Canada first, or afterwards in any of the Allied countries, that is where the business ought to go.

"There is a great tendency to forget nowadays German atrocities in the war, and there is also a tendency to forget how Germany would have treated us, if we had lost the war. True to form, she is now whining like the cowardly bully she has proved herself to be, and we want to take anything that we are told about the desperate condition Germany is in, and how she must have business with the Allies, or go absolutely under, with a grain of salt, in fact, quite a large portion of salt. We also want to remember in regard to this helping her on her feet again, that if she ever gets in a position to turn the tables on France or Great Britain, she will do it, as she has declared.

"If it had been any other country than Germany, we could look at this matter in a different light, and I think that Canadian buyers in all lines should make it a principle not to buy German goods except where they cannot possibly get them from anybody else."

CAN'T GERMANY PAY?

—Wahl in "Sacramento Bee."

**Policy Not Decided on Yet**

Butterfield & Co., of Rock Island, Quebec, have not reopened trading with Germany since the war, the exchange, of course, making it almost impossible to sell anything to that country. F. S. Laythe, assistant treasurer of the company, answering a question from this paper on the point, says:

"We are in receipt of your favor of the 8th, asking us what our position is with reference to trading with Germany. Up to the present time we have given this matter very little conssideration, as we have not been approached by German interests either to buy or sell.

"We never made any purchases in Germany, but for about 15 years previous to the war we had an agency in Germany, and while we never made large shipments, we had a nice little trade and our business connection with our agent were entirely satisfactory. Of course, when the war broke out this connection was broken and, naturally, we have done nothing with them since.

"Under the present conditions of exchange, naturally, we are not in a position to do anything with them now. What the future will bring forth, we do not know, and we are not prepared to say at this time what action we would take in the event that the opportunity of again resuming business relations with them should come up."

**Two Sides to the Question**

There are a good many manufacturers who are caught between sentiment and commercial necessity in this matter. They are not keen to open up accounts with Germany again for sentimental reasons, but over against that they consider the impossibility of trying to isolate Germany from the rest of the world and at the same time collect a large amount of money from her.

G. C. McAvity, of T. McAvity & Sons, Ltd., St. John, N.B., brings this point out in his letter:

"This particular question seems to be very prominent in all parts of the world, and there appear to be a great many different opinions regarding the outcome of same.

"It seems to me that if Germany is to pay its indemnity to the allied nations, that it is going to be necessary to trade with her in order for her to get the necessary money to make this payment. Again, on the other hand, a great many people look at this from a sentimental point of view, while others look at it from the different phase of business only. It is a pretty well recognized fact that Germany, with her low-wage scale, long hours and other manufacturing conditions, is in a position to manufacture much cheaper than we in Canada are able to do, and with the great discount on German money still in their favor, how are the Canadian manufacturers going to live if German goods are to come into this country, and be purchased? Still, if we do not buy their goods, how are they going to pay their indemnity?

"From the sentimental point of view, I, personally, do not wish to see a German article. For the other reasons, as outlined, I feel that we must buy from them. However, I am very interested to learn the different expressions of opinion from other sources."

Here is a manufacturer from Brantford who goes into some pretty sound facts regarding the turning of German goods loose on the markets of Canada. Looking at it in a broad, general way, he says:

"Personally the writer does not for a moment see how it is possible to expect payment of the German debt to the Allies unless trade intercourse is continued. Germany can never pay unless she is traded with, and I believe that all the nations should do all possible so as to enable the Germans to pay to the limit, and then take the money away from them, but Germany should be very carefully watched and her business transactions thoroughly inspected, so that any competition which comes into any line of business is a competition by fair means only.

"This has not been true in the past, and the German Government have subsidized many industries and the industries itself have sold goods at an absolute loss, and have received their profit as a bounty from the German Government. This, of course, is not fair competition.

"Again, there is the question that there are certain commodities which Germany can produce for the benefit of the world cheaper than it is possible for any other country to produce the same commodity, and she should be allowed to produce these goods and sell them, and she should also be allowed to buy from Canada or any other country such goods as these countries can produce and deliver cheaper than she can produce them.

"This letter is not written because the writer has any love for the Germans, and is written largely from the idea of benefit to the opposite side of the question, and in our own interests here in Canada."

### Requires Careful Study

That we should regard Canada first in our dealing with Germany or any other country is the contention of one of the largest firms manufacturing in the iron and steel lines. A scientific study of tariff conditions should be made, and there should be a determination to get away from any hit-and-miss policy in framing our future trading relations with Germany. Protection for the consumer is also urged.

This firm's views follow: "If Germany is to be expected to pay the war indemnity, Canada, along with the other allies, must forget to a certain extent their antipathy to trading with Germany, and must be prepared to do business with them, the same as with any other foreign country. From Canada's point of view, it would seem to me that our general policy should be to invite Germany and other foreign countries to compete in Canada for the sale of goods which we cannot manufacture at all, or cannot manufacture to advantage, and that the imports into Canada, whether from Germany or elsewhere, of goods which we can and do manufacture in Canada should be discouraged. In other words, in order to build up our country we should not buy from Germany or any other country anything that we can manufacture ourselves.

"You will perhaps remember that some time before the war a commission from Canada made a tour of Germany to study manufacturing conditions, and Government policies in Germany in connection with the building up of their export trade. At the present time we cannot recall the names of the gentlemen who composed that commission, but I believe that G. M. Murray, of Toronto, who was with the Canadian Manufacturers' Association at that time, accompanied the commission, and could, we think, give you some very valuable pointers on what the commission saw and heard in Germany.

"At the present time, when our fiscal policy seems to be paramount in everybody's mind, it would be timely to consider what Germany did in building up her industries and export trade, and instead of the haphazard kind of tariff which applies at present, we should have a scientific revision of our tariff by means of a capable tariff board, which would provide the necessary protection for growing industries, as well as protection for the consumers, and make it possible for us to do business in lines in which we ought to do business with Germany, and eliminate ruinous competition with her in lines which we can manufacture ourselves to market at reasonable prices.

"We cannot afford to treat the matter of trade with Germany sentimentally, if we expect Germany to meet her obligations, and we must be prepared to do business with her on a fair and equitable basis for such goods of her manufacture as we will require."

---

## The Use of Ball Bearings

When thinking about the installation of ball bearings, it does not pay to do **too much thinking**. After you have decided to use such bearings, do not puzzle over how you shall apply them. Leave that to those who have made a life study of the subject.

Many cases are existent at the present time where ball bearings are applied, yet not delivering 100 per cent. service. The proper application of ball bearings is a special study. There are numerous factors entering into the problem—for example, the danger of dust and dirt. This is only one of many, so why not leave the actual planning to someone who knows.

Many machine tool designers may consider this a reflection on their ability, but such is not the intention. Unless they have had practical experience in this line of work, consultation should be held with some reputable concern making such bearings as they **think** they require. We say think because in many cases the bearing they believe ideal for the purpose is not the correct type to use at all. As service of this nature is free, why not take the benefit of it?

Here is a typical case of what actually happened a short time ago. A certain manufacturer called up a ball bearing company on the phone, and this conversation ensued:

"I'm developing a new machine, and I want some advice regarding ball bearings. Will you come up right away?"

"I'll be out there within an hour," was the reply.

Soon the chief designer, the manufacturer and the ball bearing expert were delving into the problem, with the result that everybody was satisfied. The manufacturer knew he had secured the best of advice, the designer had learned something fresh, while the expert had stated what in his opinion would suit the machine. Even the ultimate user of the machine got better value for his money, for he received the benefit of an ideal installation.

# MARKET DEVELOPMENTS

## Slight Improvement Noticed in Markets

### Pittsburgh Says The Demand for Steel is a Little Better, While in New York Tools Are Being Inquired For—Toronto Business Shows Small Improvement in Some Lines

THE general tone of business in the machine tool, steel and iron markets is slightly better this week. This does not mean that any great amount of bookings are being made, but it does mean that more orders are being received by several lines, and that in others inquiries of a perfectly reliable sort are being received.

In a good many lines it is still true that prices are not allowed to stand in the way of orders not being placed. Small tools and some lines in the steel warehouses are going out under these circumstances. Here is a peculiar situation, though, which is developing. Warehouses have not been buying for some time. They have been busy liquidating the stock they had in hand, depending on the mills to give them quick delivery on lines they were running short of. During the past week it has developed that some warehouses have lines in demand, while others have not, with the result that there is no more losing liquidation on the part of the firms that have the wanted lines. They are able to sell at a profit.

Nothing definite is heard in regard to prices in the steel market coming down any farther. The Corporation schedule still stands, and its selling agencies in Canada are working on that basis, but the independents are coming pretty well under the market. It is doubtful, though, if much real tonnage has been brought into the market by any of the price slashing that has taken place.

The scrap metal market does not improve. Any movement at all would probably be for the better, for dealers feel that it has about run its limit as far as low prices are concerned. Some of the railroads and industrials in United States continue to offer their sortings at lower prices, preferring to turn them into cash. The result is that, although prices are very low, there is no guarantee that they have yet touched bottom.

## MONTREAL LOOKING FORWARD TO THE OPENING UP OF NAVIGATION

Special to CANADIAN MACHINERY.

MONTREAL, March 24.—The continued mild weather, accompanied by wind and rain, has served a good purpose in the way of clearing the ice from the River St. Lawrence, and it looks as if it is only a question of a few days before the harbor will be open. Officials anticipate the first of April at the latest. What effect the opening of navigation will have upon business in this district is, as yet, uncertain, but, in former years, it has always aided in relieving the tension that has been more or less marked at an ocean port during the closed season. The opening of Montreal port has always created a spirit of enthusiasm amongst merchants and should do likewise this year; in fact, some state that business will improve with the commencement of navigation. While some of the railroad shops here are contemplating further curtailment or shut downs for short periods, there is increased activity in other directions. The Dominion Engineering Company across the river are commencing operations and other engineering firms are reporting steady activity, but seldom of a brisk character. Manufacturers, as well as dealers, are apparently waiting for something to break.

### No Demand For Steel

"It would be going beyond the bounds of good judgment to say that a change for the better has taken place, but our business for the past week has been larger than for some weeks back. Of course, we may be faced with lesser business this week, which would counteract last week's good sales. However, we have been cheered up a little, and even though the betterment is of a passing nature, the thought alone keeps us optimistic." This statement by a steel merchant here might imply that conditions are improving, but when one takes into consideration the poor business that has been going, any improvement over previous weeks, unless it be of a considerable character, would give little encouragement to the average merchant. When asked as to the probable duration of present depression, this dealer was reluctant to make a statement, as he said he had hoped, earlier in the year, to see things picking up before this date, and that here we were with the prospects almost as obscure, if not more so, than at the beginning of the year. The conservative attitude that dominates all phases of the steel business is very pronounced. Consumers buy in small lots for present requirements, and dealers carry as light a warehouse stock as is consistent with the needs of the trade. The general report from dealers is that there is "little doing." As stated in one instance: "We are just sitting here waiting—how long this wait will be we cannot tell, as the slight fluctuation in demand shows no signs of steady improvement; it is up a little today and down again tomorrow."

### Supplies Selling Best

Little more can be said of the machine tool trade than that many of the dealers are carrying on, seemingly content to keep things going during this period of pronounced depression. The sale of equipment now is a hard proposition, and it is a clear case of need when the manufacturer buys machinery or material. Although the sale of equipment is proportionately light the keen competition amongst salesmen to get business of any kind, makes it possible for users to get their needs supplied at surprisingly low figures, particularly if they can afford to take the time to get the varied quotations from the different dealers. An inquiry

that does not net business makes the dealer feel that some other fellow has under-quoted him, and the possibility is that the next inquiry will result in a lower price. This cannot be done in all cases, but on many lines this attitude is followed in getting business. The market on the surface seems quite clear but closer contact, when actually buying, indicates the presence of air holes into which the customer is drawn by the current of the trade. The "heavy" business at present is being done in the lighter supplies.

### Prospects Little Brighter

The light movement of old material continues to keep the market in a depressive mood. The demand for scrap of all kinds is practically nil, and it is generally only regular customers that are buying at the present time, and then in such small volume that other than passive interest is not aroused. The situation just now is not one that is controlled by price, as quotations are little guide to actual sales figures. "Supplies we have on hand just now," said a dealer, "were acquired at prices higher than are now quoted, and we are endeavoring to dispose of much of this before we take on any more material. This, however, is subject to trade requirements and with buyers virtually out of the market, it looks as if it would be some time before we can expect a stable condition." There is not the same hopeful spirit that there was a couple of months ago, and instead of looking for a betterment in the early spring, the general opinion seems to indicate an extended period of existing dullness. Prices are unchanged but the trend is weaker.

## BETTER REPORTS ABOUT BUSINESS

### Firms Have Reason to Believe That Corner Has Been Turned Toward Better Days

TORONTO.—No one seems prepared to stand up yet and admit that he is getting any more business than he can conveniently handle with his present staff, but there are a number of firms quite willing to admit that they can see an improvement in business, and that last week was by far the best one this year.

Inquiries continue to come into the market, and although they do not represent a great deal in the way of closed business, they are accepted as good working material by the firms interested.

Collections continue to be fairly slow in some lines, while other firms report that they are having very little trouble with this matter, apparently indicating that firms that make collecting a real job are finding now that their well-organized department is coming in very handy, and making financing much easier for them than would otherwise be the case.

### The Machine-Tool Market

Machine-tool dealers are closing a fair amount of business, most of it pretty well scattered, and in the shape of additions to existing plants, rather than new installations.

One dealer, who has covered quite a wide range of territory during the past few weeks, reports that while he did not close much actual business he is more than ever satisfied that the corner has been turned, and we are on the way back to better days.

Business in the East, he claims, is slow, there being little to accelerate buying there. In much of the country it all depends on the steel and coal business, and in the former there is little activity just now. Around Halifax things were quiet, too, and with the exception of a couple of Government ships in the yards there, there was nothing in the ship yards but repair work.

### Railroads Not Buying

There was some expectation, apparently not very well founded, that the railroads would be doing a lot of buying about this time of year. One of the officials, discussing this matter just a few days ago, explained that it was not likely that extensive buying would be done now, although some of the shops were in need of equipment. The weather had been very kind to transportation during the winter months. The absence of snow had made it an easy matter to keep the rolling stock in very good shape, and so there was no call for additional machine tools now. Then there are the Government roads, this same dealer went on. If a private concern were as hopelessly in debt as these roads are we would not look upon them as very good prospects for placing equipment. It may be that a great deal of reorganization is necessary in the case of the latter, he continued, and this reorganization might find it very advantageous to have much better equipment than many of the Government shops boast at the present time.

### Prices of Tools

Old country machine tools have stayed up pretty well in price, but there are indications of a change in this attitude, and the buyer can sit in now and talk price to them and they are disposed to listen. Machine tools are not moving out very rapidly in England now, and in some cases the larger makers have accumulated quite a supply, something that is rather unusual in their history. In quotations that have been made in several pieces of special equipment recently prices put in by British firms are lower than those submitted by the makers in other countries.

### The Steel Market

"There were days last week when it seemed almost like dipping in on the

## POINTS IN WEEK'S MARKETING NOTES

**Pittsburgh reports that the Steel Corporation during the past week has not been operating much more than fifty per cent. capacity.**

—

**The price for pig iron in some of the U. S. districts shows a tendency to go even lower, although $25 is still recognized as the bottom figure.**

—

**There has been a fair demand for sheets during the week in Toronto warehouses, industries connected with the pulp and paper business and with some of the northern mines doing the buying.**

—

**According to advices there may be a drop in the price of some British machine tools before very long.**

—

**Boiler tubes are being sold in fair quantities, the bulk of the sales apparently being for the smaller sizes.**

—

**Bar mill material, especially for reinforcing purposes, is not selling as freely as it should be at this time of the year. Slowness in getting building operations under way is responsible for this.**

—

**Several large makers of machine tools in United States have sent out notices of reductions in their selling prices, generally running from ten to fifteen per cent.**

—

**The past season has been a very light one on railroad upkeep work, and for that reason the shops have not found it necessary to purchase the amount of equipment expected.**

—

**Small tools are being sold in very small lots, and some of the dealers are complaining that prices are being cut to secure the little business that is offered. According to some reports business is being done at as low as five per cent. profit.**

—

**The directors of the Dominion Steel Corporation and the Nova Scotia Steel and Coal Company met at Montreal on March 21st to discuss the proposed amalgamation of the two companies with the Halifax Shipyards in the British Empire Steel Corporation. After the meeting it was announced that both boards had approved of the contracts covering the consolidation and that special meetings of both the Steel Corporation and Scotia common shareholders would be called for April 7th next**

1920 business again," stated one of the steel merchants this week. "We are not interpreting this as meaning that things have turned all at once for the better, but there can be no denying the fact that we find a gradual improvement."

Sheets were good last week, and still are, and a fair tonnage has moved out. Black (28) gauge is quoted at 6.50, while blue annealed is sold at 6c. A variety of interests contributed to the business that came in during the week. Warehouses are not taking on very much material now, in fact some of them prefer to turn their orders direct to the mills, and for this district very direct motor delivery service is being made from Hamilton. This lets the warehouse out of loading up with a very heavy stock, and it must also have the effect of holding quite a lot of trade in Canada that would otherwise go over the border.

### Some Lines Are Short

The warehousing situation is getting to an interesting stage just now. The buying that is being done by the merchants is small, and can more correctly be referred to as releasing material rather than purchasing it. In some lines where there has been a decided effort toward liquidation, stocks are getting fairly low, with the result that business has to be directed to the places carrying these lines, if quick shipment is desired. The result is that merchants having well-assorted stocks are able again to get their price without having to slash away at a rate where no money was made. Of course this is not a general condition, but it has taken place, and is taking place. Warehouses are not minded yet to do much buying, claiming that they can get very prompt mill delivery, and that mills are encouraging them to send in much smaller amounts than formerly.

### The Sale of Tubes

Tubular goods are moving out fairly well, and in this the small sizes are perhaps leading, tending to show that small industrial concerns are overhauling their plants while in the case of the larger power plants things are being passed up for the season as far as repairs are concerned.

There is a fair demand for reinforcing material, although the demand is hardly indicative of a very active season's work in the building trades. Industries that have work from the pulp and paper mills are buying a fair amount, while some of the mines are also taking on a few carloads. There is perhaps nothing unusual about any of this business, as in ordinary times the buying would be still larger, but any kind of business is welcome in the market under present circumstances.

There have been some disputes over shipments sent in here from some of the United States mills, and a number of cars have been sent back.

### Small Tools Are Slow

Small tools are moving slowly, and firms requiring these are buying what they need for right now. "In fact, you would think they were all going to close to-morrow by the way they are buying to-day," remarked one dealer who was complaining of the smallness of the orders, particularly during the present month.

One also hears a good many reports of price cutting that is being done in the small tool market. "They all get together, and decide to play the game square and sell on the quality of goods and ability to make deliveries by the consumer, and all goes well for a short time. But once things get scarce, believe me the prices begin to fly. I am certain there are jobbers right in this district now that are doing business on a 5 per cent. basis. Ten per cent. is the proper basis, and it is not possible to operate below that, especially when the volume of trade going is smaller than usual."

# PITTSBURGH REPORTS A BETTER TONE IN THE MARKET WITH SOME ORDERS

Special to CANADIAN MACHINERY.

PITTSBURGH, March 24.—There has been a further increase in the volume of steel business over that noted in last report, and in addition a little inquiry has appeared from steel works for basic pig iron. The beginning of improvement is very modest, but there is at least a beginning. It requires close scrutiny to discern any change, but business has been so bad that everyone is willing to make the effort necessary to see even a small improvement.

The improvement does not mark the beginning of a spring buying movement according to those who analyze the orders that come in. The buying is the beginning of a reaction from the extreme stagnation of the past few weeks, a stagnation that could not continue indefinitely, for the buying was far below the amount needed to keep operations going even on the limited scale that characterizes a period of hard times. That is, after every period of great activity there is a special period of stagnation during which time old orders are worked out and stocks are consumed. Then, if ultimate consumption does not increase, there must nevertheless be hand-to-mouth buying, and that is what is now starting.

A spring buying movement is to be expected, but it is not discerned yet. When it comes it will simply add to the activity, and it is certain to come very shortly. For the general and widespread improvement, from the long range viewpoint, one must still wait. That is in the uncertain future.

### Production and Demand

While production of pig iron and steel products has been constantly declining, it has been far above the quantity of expressed demand. The latter is increasing, but for the two to meet the one must decline further and the other increase. The meeting will now occur in a very few weeks.

The independent steel interests are not operating any better than a few weeks ago, and indeed hardly as well. Previous records have indicated that the independents as a whole ran at nearer 30 per cent. than 25 per cent. in January and at nearer 25 per cent. than 30 per cent. in February. For the present rate, some estimates are 25 per cent. but others only accord the independents 15 or 20 per cent.

The Steel Corporation's operations have decreased more sharply in the past week than in former weeks, the Corporation's highest production having been in December and up to the middle of January, whereas the independents had already reached a point of curtailing operations. Generally speaking, it may be said that the Steel Corporation's declining operations have come just above four months later than was the case with the independents, this being the sequel to the Steel Corporation's holding its prices down late in 1919 and in 1920 while all the independents advanced their prices.

The Carnegie Steel Company, which was the highest operating subsidiary of the Corporation outside of the National Tube Company, has had the greatest decline. In the past week or ten days the Carnegie Steel Company has made a new record, by blowing out 13 blast furnaces in that short period, reducing the active number from 38 to 25. The company's high point was 48 furnaces active, for a time last January. Last week's ingot production by the Carnegie Company was about 45 per cent. of actual capacity, against about 60 per cent. the previous week. The ingot production by the Steel Corporation as a whole was about 45 per cent. last week against about 55 per cent. the previous week.

### Prices

Except in sheets there has been no noticeable decline in the past week in steel prices done by independents. The Steel Corporation continues to maintain its prices and shows no signs of contemplating any reduction in the very near future. While it may not be clear to outsiders who have publicly suggested that the Steel Corporation ought to reduce its prices, it is plain to those in the trade that there would be no stimulus given to business by such action. The Steel Corporation's customers as a body do not desire that the Corporation reduce its prices at this time, and indeed not a few of them have placed them-

selves on record as fully approving the Steel Corporation's policy of price maintenance. It is a plain matter of business. These customers have stocks of steel or of finished wares or both, which they want to dispose of to the best advantage, and a reduction in the official steel prices would simply depreciate the value of this material. If the customers wanted to buy large quantities of steel the case would be different, but they do not.

Sheets can now be done in carload lots at 3.85c for black, when a week ago it required a larger order to bring out a price under 4c. Galvanized sheets are easy at 5c for carloads, with possibilities of shading this on larger lots. Blue annealed sheets are quite neglected, 3c. being commonly regarded as the market, but possibly a buyer with a fair-sized order might develop something less. The heavy gauges can, of course, be bought for considerably less, on the plate mill schedule.

Bars remain quotable at 2c and shapes and plates at 2.10c. These prices can now be done on single carloads, if the specifications are satisfactory, and that may represent a slight easing off, since a fortnight ago one would probably have to offer more than a carload to get such quotations. The minimum done on plates seems to be 1.90c, this being on a very attractive order.

### Pig Iron

Inquiry for basic pig iron is small but it is easily the best seen for many weeks, there being live inquiry for 3,000 tons from a consumer west of Pittsburgh and inquiries for 1,000 tons each from a steel interest in the Shenango valley and a steel works in the Allegheny valley. The tone of the market is a shade better. The merchant furnaces will not budge a cent on these inquiries from their regular quotation of $25, valley. It looks now as though the steel works that had accumulated some iron by not slowing down their blast furnace operations as rapidly as they did their steel works will not dump the iron accumulated on the market but will keep it for their own use. There remain the brokers, who have some iron, and who will probably get the orders now going by shading $25, but the merchant furnaces feel that the iron will have to be gotten out of the situation some time and now is the best time.

Bessemer iron remains quotable at $27, valley, and foundry at $26, with no inquiry worth mentioning.

The offical report of pig iron production in 1920 has just been made, the total being 39,925,987 gross tons, against 31,015,364 tons in 1919 and the record of 39,434,797 tons in 1916. Capacity is about 45,000,000 tons, while production in the past week or so has crossed under the 20,000,000-ton line.

## FEW MORE CUTS IN N. Y. MARKET

**Railroads Are Not Buying Until the Talk of Strike Has Been Settled**

Special to CANADIAN MACHINERY.

NEW YORK, March 24.—There is a little more life in the machine-tool trade, but it is confined mostly to inquiries. Actual orders in some lines, notably milling, grinding machines and punches and shears, are being placed somewhat more freely, but there is still much to be desired even in these lines.

The tendency of prices continues downward. A leading manufacturer of lathes and milling machines has reduced prices on milling machines about 15 per cent. and is expected to announce a 10 per cent. reduction on lathes also. Some other lathe manufacturers have made reductions.

The most important inquiry of the past week was from the General Electric Co., Schenectady, N.Y., for about thirty machines. When the slump in machine-tool buying occurred last fall, the General Electric Co. stayed in the market for a considerable time, but finally stopped all buying before taking final action on several fairly large lists it had issued for its various plants. The inquiry received here last week is the first indication that this non-buying policy has been changed. No orders have been placed yet by the American Sugar Refining Co., New York, or the Batavia Car Works, Batavia, N.Y., whose inquiries were reported a week ago, but it is expected that the business will be placed soon.

The trade lacks snap, but the improvement in inquiry has created a better tone among sellers in some lines, while in other lines things remain as dull as they have been at any time during the past few months.

Except for more prospective buying by the Japanese Government and an inquiry from a Porto Rican sugar company there is scarcely a sign of life in the export machine-tool trade.

The railroads have a number of small inquiries out, but it is doubted that orders will be placed until the present controversy between the roads and their employees over the wage question has been settled.

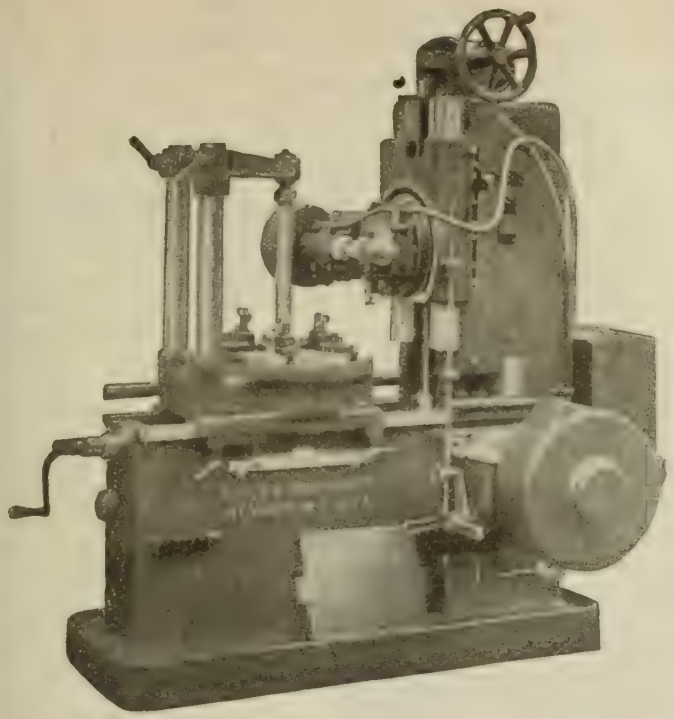
### KEEPING UP THE GOOD WORK

It is said that rapid progress is being made with the special process of electric welding which was successfully employed by the British Admiralty during the war in the construction of a "riveteless" 1,000-ton steel barge for transport purposes.

The peculiarity of this process is the use of special electrodes covered with flux, which prevents the oxidation of the welding metal. Further, by using electrodes and fluxes of special composition steel of any particular character —mild steel, nickel steel, high-tensile steel, vanadium steel, and so on—can be deposited direct. Cast-iron of good quality can also be obtained by this system of welding. Extensive repairs are being carried out in worn tramway tracks, cracked omnibus wheels, and old motor car shafts, and a company has been formed for the production of welded motor car wheels. An important feature is that only a moderate amount of skill on the part of the operator is required to secure satisfactory results.

## DOES THE PRICE DETERMINE SALE?

**One Dealer Passes Along Some Observations Made in Recent Days**



Is this a price market for machine tools and similar articles, rather than a place where quality is highly considered?

The question is prompted because one of the dealers in Canada believes that price is one of the great factors on determining sales here now. His belief seems to have been strengthened lately by coming in contact with another salesman who was out selling a high-grade article, the chief competition to which came from a much cheaper make.

The last-named man was out selling a high-grade magneto, but he found that he could not sell against some of the makes that seemed to have the run of the market at a lower price. There is no question that the article of the high price is a superior one, but it can't be sold in the present competitive market.

One of his customers, a maker of tractors, told him, "We have to make things with regard to price. We put the most quality we can in, and try to turn out something that will stand up and give the purchaser his money's worth, but we have got to cut out the high quality in order to get down to the price at which the thing will sell." The salesman handling the magneto has written his firm asking for a re-design that will bring the article down to the price the people here want to pay. If they will agree to this proposition he seems to think there is a big field in which to do business, but if they insist on keeping up to a price they might as well leave the market.

We are not making any comment on this, simply passing it along as one of the opinions of the Canadian market that one hears in the course of a day spent around the warehouses and supply stores.

# MONTREAL NOTES

E. T. Spidy, who for the past several years has been production engineer at the Angus shops of the C.P.R., has severed his connection with the railroad company to become associated with the Dominion Engineering Company, being appointed to the position of assistant superintendent. On the occasion of his leaving the C.P.R. Mr. Spidy was presented with a silver tea set and a handsome travelling bag.

* * *

The Canadian firm of Torrington Company at Upper Bedford, Quebec, who for many years have been manufacturing knitting machine needles, have installed equipment for the making of all kinds of machine screws, cap and set screws, etc. Production will show rapid development from now and they are now in a position to supply the trade demands for these products. David J. Reid is the manager of the Canadian Company.

* * *

To further the construction of the new Labor Temple in the city of Montreal, the company, which was incorporated some time ago with a capital of $500,000, has appointed a permanent executive to carry out the necessary work. The various labor unions in the city are interested in the venture and it is not thought that any great difficulty will be experienced in the raising of the money. The new executive is as follows: President, Arthur Martel; vice-president. J. T. Foster; secretary, A. Bastien; directors, Gustave Francq, J. Lesperance, B. Drolet, J. L. Bourbonniere and S. Clegg.

## NICKEL PLANT TO RESUME WORK

Sudbury.—The British-America Nickel Corporation will resume operations about April 20.

The new plans of the company are not for the complete operation of the plant as before it was closed down a couple of weeks ago.

Instead it is the intention of the company to leave the smelter closed for the present, but a good sized force of men will be put on to carry out a programme of underground development.

The fact that the company needed considerable underground work for the efficient working of the Murray Mine has been known for some time.

A second shaft has been necessary, as since the mine has been operating practically all the ore hauled to the surface went into the smelter direct, and there was little opportunity to pile up an ore dump on surface. A second shaft would overcome this. However, the blocking out and stopping of the ore bodies has been kept but little ahead of the actual mining operations, and it is understood that the work which will start towards the latter part of April will have the solution of this problem in hand.

The corporation has already selected all the men required for this work. They were not dropped from the payroll, but were really given a holiday.

These employees have been told to hold themselves in readiness for a call some time about the 19th of April.

The refinancing of the corporation has been completed and the Norwegian State Bank is lending their assistance to the corporation. Plans to resume work are timed to fit in with the receiving of the news that the loan has been confirmed.

The Norwegian Government has taken a material interest in this venture prior to putting its approval on the present investment of some two million dollars by the Norway bank.

---

During 1920 the number of large incandescent lamps sold in the U. S. totalled about 231,000,000. Of this amount about 215,000,000 were tungsten filament lamps and 16,000,000 carbon filament lamps. This means that 93 per cent. of the lamps sold had tungsten filaments. According to these estimates, the large lamp business of 1920 represents an increase of 25 per cent. over 1919.

# A Geometric Die Head for the Brown & Sharpe Automatic

The Geometric Die Heads for the Brown & Sharpe Automatic Screw Machines are arranged with an adjustable locking bolt. This provides a ready means for governing the point of tripping the Die Head.

The closing handle is located in a convenient position to strike a stop on the machine, which automatically closes the Die Head when the turret revolves.

The Die Heads are provided with shanks to fit the particular size machine on which they are to be used.

| Geometric Die Head Size | Brown & Sharpe Mach. Applied to | Capacity | Shank |
|---|---|---|---|
| 5-16″ C. B-4631A | 00 and 00G | 1-8″ 5-16″ | 5-8″ x 1 5-16″ |
| 9-16″ C. B-4631B | 0 and 0G | 1-8″ — 9-16″ | 3-4″ x 2 1-16″ |
| 3-4″ C. B-4631C | 2 and 2G | 1-4″ 3-4″ | 1″ x 2 3-8″ |

The use of these Die Heads makes unnecessary the reversing of the spindle to back the Die off the threaded work.

Thy are especially useful for threading operations when only one spindle pulley is available for driving, or on machines not arranged to reverse.

**All sizes of these Die Heads carry four chasers.**

# INDUSTRIAL NEWS

## NEW SHOPS, TENDERS AND CONTRACTS PERSONAL AND TRADE NOTES

## Engineering

The Dundalk Woollen Mills will be rebuilt at an estimated cost of $25,000.

Louis Herschorn, 167 St. Paul Street East, is planning to alter warehouse.

The Neal Baking Co., Windsor, Ont., are planning a new bakery to cost $250,000.

Joseph Crane, of New Westminster, will construct a shipyard at North Vancouver, B.C.

H. B. Charade, 2770 Hutchison Street, Montreal, is contemplating the erection of an automobile repair shop.

A moving picture house will be erected at Moose Jaw, Sask., by the Famous Players Moving Picture Corporation.

A warehouse will be erected at Lethbridge by the Winnipeg Oil Company, Erin and Notre Dame Avenue, Winnipeg.

J. H. Stewart, architect, 344 Lister Street, Hamilton, Ont., will receive tenders for erection of garage estimated to cost $40,000.

An attempt is being made by the local board of trade to have the Port Arthur Structural Iron Works locate its plant at Sault Ste. Marie.

Owing to the partial collapse of one of the wing dams, the 1,500 horsepower electric plant at Parry Sound is almost a complete wreck.

The Fairweather Building, 297 Portage Avenue, Winnipeg, is to be remodelled into a restaurant to be operated by Julius Bros., 538 Main Street. The cost is estimated at $90,000.

A theatre will be erected by the Winnipeg Amusement Co. at the corner of Main and Church Streets, and the general contract has been placed with Sutherland Construction Co., 301 Merchants Bank Building.

The Normandy Sales Co., Ltd., has been incorporated with head offices at Toronto, and capital stock of $50,000, to carry on the business of making, buying and selling automobile tires, tubes and auto accessories of all kinds.

It was stated by Col. E. W. Steadman, A.R.C.S., at the annual popular lecture by the Engineering Institute of Canada in the Victoria Museum, Ottawa, that German-made mercantile airplanes are being made and laid down in Canada, while British manufacturers are being forced to close their factories owing to lack of support.

## GERMANY IS REBUILDING HER FOREIGN TRADE VERY RAPIDLY

The foreign trade of Germany, to which the London conference gave much attention in its discussions and plans, apparently amounted, says a statement by the National City Bank of New York, to nearly or perhaps quite $2,000,000,000 in the calendar year 1920, as against about $5,000,000,000 in the year prior to the war, though the ratio of "total values" of 1920 compared with those of 1913 does not, of course, indicate a corresponding ratio in quantity, since prices of 1920 were much higher than those of 1913.

This estimate of approximately $2,000,000,000 as the total foreign trade of Germany with 60,000,000 population in 1920, as against $5,000,000,000 with 67,000,000 population prior to the war, is necessarily based upon the trade figures of the countries buying from or selling to her, since her own trade figures at the present time are not only fragmentary, but stated in units of a depreciated and constantly fluctuating currency.

The race between the United States, Great Britain and France to regain trade with Germany has been a close one. Official records of the three countries in question show that the trade of the United States with Germany in 1920 was $390,000,000, that of Great Britain £82,255,000 and that of France approximately 3,500,000,000 francs. Belgium and Italy also showed an equal trade willingness to "forget the past," while the neutrals on all of her frontages, Switzerland, Netherlands, the Scandinavian States, Czecho-Slovakia, Poland, and even Soviet Russia, showed marked gains over the preceding year, apparently bringing the grand total of Germany's foreign trade in 1920 to approximately $2,000,000,000.

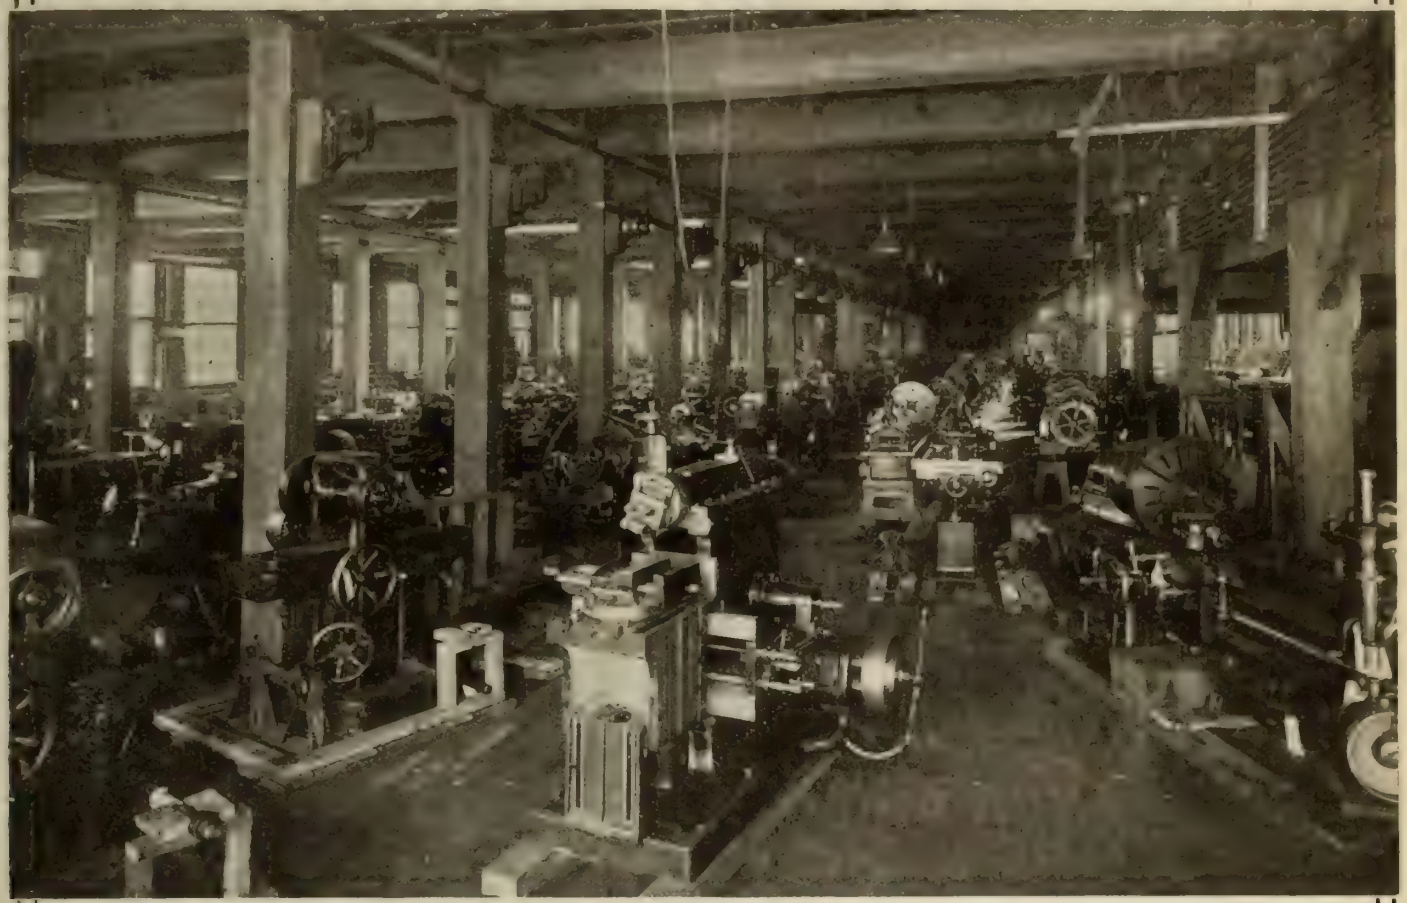
---

Frank M. Foster, transportation engineer, Windsor and Detroit, has purchased 51 feet by 110 feet on the north side of Pitt Street, Windsor, Ont., where he is intending to build a large passenger car service station and motor show rooms.

The Dodge Brothers Motor Car Co., which has been closed since last December, reopened on March 17 with a force of between 3,500 and 4,000 men, it was officially announced at the company's offices. The company normally employs 20,000 men.

A very enjoyable evening was held at the King Edward Hotel, Toronto, by the firm of Barber, Wynne-Roberts & Seymour, consulting engineers, of Toronto, on the occasion of their first annual banquet on Friday night.

The Universal Tires, Ltd., has been incorporated with head office at Montreal, and capital stock of $50,000, to carry on the business of dealers in automobile tires and accessories and to manufacture, buy, sell, repair and deal in automobile tires, etc.



A warehouse will be erected shortly by an American plumbing and hardware supply company on York Street, London, Ont. The new building will be three stories in height and will cover approximately 4,000 square feet.

The Hart Stocker Co., Ltd., Edmonton, Alta., has been incorporated with capital stock of $2,000,000 to carry on the manufacture of farm implements, machinery, etc.

The Smiths Falls Malleable and Castings Co., Ltd., Smiths Falls, Ont., recently incorporated, have increased their capital stock from $150,000 to $750,000 and provision is made for the manufacture of steel castings. The company plan to double the capacity of their No. 2 plant and also equip a machine shop.

**New Arrangement.**—The General Combustion Co. of Canada have secured the Canadian representation for T. H. Watson & Co., of Sheffield, England, and will handle, build and sell their various electric smelting, melting and refining furnaces. The Canadian company will also handle the "Greaves-Etchells" type of furnace, largely used in United States and European countries. The General Combustion Co. are also taking over the designs of the Electric Furnace Construction Co., of Philadelphia, on the different types of electrically heated core ovens, annealing and heat-treating furnaces, and will have the active cooperation of the American company in the solution of furnace problems generally.

# MACHINE TOOLS

## From This Immense Stock we can Meet all Requirements of the Metalworking and Woodworking Industries

Included in this exhibition of machine tools are lathes, planers, millers, shapers, drill presses, grinders and other metal working tools in a variety of designs, in addition to a complete line of woodworking tools—band saws, jointers, saw benches, surfacers and pattern makers lathes, etc.. etc.

G&W MACHINERY

There is a variety of used machine tools in stock at our warehouse, many of them as good as new. You can save a good deal of expense by purchasing these machines, and they are warranted to give first-class service. We will be pleased to answer your enquiry.

# PURCHASING AGENTS START MOVE TO MAKE CONTRACTS BINDING

By HARRY BOTSFORD

"TWO months ago," a paper salesman told me the other day, "I had over $190,000.00 worth of orders on my books. Yesterday the president of the company called me in and told me that, due to cancellations, those same orders have dwindled to $10,000.00. Isn't that enough to discourage a fellow?"

The salesman was right—it is enough to discourage even the most stout hearted of individuals! As a matter of fact the above situation is too common to-day and it is one of the most disturbing factors that business has to contend with in this day of getting back to normal conditions. The contractual break-down is directly allied to the cancellation evil and while business men, as a rule, fume and fret over the deplorable situation, apparently little or nothing aside from a few strictly temporary emergency measures have been adopted or tried out with a view of eliminating the present evil.

The National Association of Purchasing Agents have long realized that a solution to the problem must be found and that such a solution must be arrived at by a calm getting-together of both sides affected by the issue and trying to reach some equitable, practical and inviolate form of contract which will not place any unfair burden on any of the parties concerned.

In their effort to make contracts safe the National Association of Purchasing Agents are co-operating with various trade, manufacturing and professional associations in the United States and Canada in an attempt to arrive at a co-operative contract form which will be possible to standardize. The N. A. P. A. intend to reach a contract form, which, when universally accepted and established, will result in a crystallization of business opinion toward living up to contractual obligations.

The working plan of the N. A. P. A. is simplicity itself. Each of the national commodity committees will work out a contract form meeting with their specific needs. This, in turn, will be presented to particular trade, manufacturing or professional organizations interested and suggestions and revisions requested on the form. If necessary joint conferences will meet and arrive at mutual agreements.

When the various commodity contracts are worked out they will be turned over to the standardization committee, who will then draw up a basic standard form of contract, which will meet the need of every industry, and, in conjunction with the commodity committees, make provisions for each special commodity requirement.

This briefly, is the definite program worked out by the National Association of Purchasing Agents. It is the organization's wish that every business firm and association will co-operate with them in this matter. It is not the purpose of the N.A.P.A. to inaugurate a contract form that will merely satisfy the buyer, but rather a contract form that is mutually fair in every phase to buyer and seller alike.

The N.A.P.A. have taken the initiative in the solution of this tremendously important problem and in the immense amount of work involved they must have the confidence and co-operation of the entire business and industrial world. Any suggestion as to the proposed form will be welcomed at the national headquarters of the National Association of Purchasing Agents at 19 Park Place, New York City.

Let us all help to make contracts safe.

# WELDING SOCIETY ELECTS OFFICERS

**Newly Formed Association Will Go Ahead and Do Educational Work in Canada**

The recently formed Canadian Welding Society held a meeting this month in Montreal, when the following officers were elected: J. H. Wood, Canadian manager of the Commercial Acetylene Supply Co., of Toronto, was elected president; first vice-president, T. Jones, works manager of the Canadian Vickers, Ltd.; second vice-president, H. E. Musset, sales manager of the Canada Carbide Co.; both vice-presidents are Montreal men.

The six directors are F. Borys, of L'Air Liquide Society; R. H. Combs, of the Prest-O-Lite Co.; F. C. Hamilton, of the Canadian John Wood Co.; J. G. McCarty, of the Metal and Thermit Corporation; A. J. McDougall, of the National Electric Products Co., and W. F. Thatcher, of the Dominion Oxygen Co.

## Scrap Metal Market

The scrap market continues to decline.

On the Chicago market it was thought the bottom had been reached, but practically all grades have gone considerably lower. Railroads continue to pour out large lists and as they need the cash realized from this material, they are letting it go at the low figures offered.

The scrap prices are so low at Boston, that small dealers say they cannot pay loading and cartage charges and net a profit even if the material were given them, particularly is this true of turnings and borings which are down to $5.50. Mixed borings and turnings in fact have sold as low as $4.50.

Considerable weakness is shown in scrap prices on the New York market, and only a few if any grades have not dropped off during the past few days. City wrought is scarce and firm, but the other grades have declined from $1 to $2. A factor in the present decline is the low prices dealers can do in buying from the railroads.

Practically no market exists at Pittsburgh, as where ordinarily 1,000 tons would represent a minimum sale, sales at present involve single carloads. Heavy melting steel is down from $15 to $16, to $13 to $14, and bundled sheets from $11 to $12, to $10 to $11.

The scrap market at Buffalo is quiet with little inquiry. The principal interest is trading between dealers in a few cars of stove plate and No. 1 cast scrap. The stove plate is bringing $18.50 to $19, the cast about $20. One steelmaker is still paying $13.50 for heavy melting steel, and picking up a few lots at this price.

## Pig Iron Market

The downward trend which has characterized the pig iron market for many weeks continues.

On the Pittsburgh market only two sales of importance were made during the week. A merchant producer with furnaces in the Valley reports a sale of 1,500 tons of standard basic for immediate delivery to a Pittsburgh consumer at $25 furnace. One company closed for 500 tons of basic at $22.75, valley furnace, but this iron was purchased from a middleman, and it is thought will come from some of the large stocks lying in the yards of steel manufacturers in the Mahoning Valley. There is very little interest shown in Bessemer, and very few inquiries in foundry iron.

Chicago reports that a melter in Wisconsin who recently bought 2,000 tons of Northern foundry at $26 delivered has purchased a like amount at the same price. A sale was made of 200 tons of Southern foundry at $24 base Birmingham. Generally speaking, the market is quiet and prices continue to slide downward.

On the New York market a sale was made of 500 tons of No. 2 plain pig iron for prompt delivery at $24.46 eastern Pennsylvania furnace. This is the lowest price which has been recorded. The seller will not sell any more at that price and is now asking $26 furnace. There is a little improvement in inquiry, and one firm is figuring on several thousand tons for prompt shipment.

The market shows very little change at Cleveland. One interest reports sales in prompt shipment foundry iron during the week aggregating 2,000 tons and including one 500 ton lot for shipment to New England. This business was taken at $26. This is the usual quotation on foundry iron in the Valley district, but $27 is being quoted by most of the local furnaces.

The Buffalo market shows no improvement from the low ebb reached last week, nor is there much change in sight in the immediate future. Sales are light, a total movement of 2,000 tons for the week is reported by one furnace. Inquiry is poor. Little is heard of resale, and this is a hopeful sign to furnace interests which see a possibility that buyers of resale iron will be obliged to deal with furnaces rather than brokers.

Philadelphia reports that the sales of the week have been confined to foundry iron, a total of a few thousand tons, including one lot of 1,000 tons and another of 600 tons. Prices on this business have ranged from $25 to $26 furnace for iron analyzing 1.75 to 2.25 silicon.

## Personal

Senator Smeaton White, of Montreal, was elected to the board of the Steel Company of Canada at a meeting of the directors. The election of Senator White was to fill the vacancy created by the death of Francis H. Whitton, of Hamilton.

The death occurred on March 16 of Kenneth A. MacKenzie, of the Technical School staff, Toronto. Mr. MacKenzie has been with the Technical School since 1917. Previous to that he was a teacher in the public schools of Weston and Bolton, being later engaged in engineering work in British Columbia and other parts of the West.

J. C. Blair, Canadian representative of the Alfred Herbert Co., has returned to Toronto after an extended trip through the eastern territory, including Montreal through to Halifax, and also including steel and coal areas of Nova Scotia and Cape Breton. Mr. Blair was particularly impressed with the reception accorded the presentation of his case for British-made goods, this being the first time he has had the opportunity of going over the ground personally since coming to Canada.

### NEW CATALOGUES

Those interested in any of the catalogues described below can procure a copy of the same by writing direct to these firms. Mention that you noticed this in Canadian Machinery.

#### ROLLER BEARING BOOKLET

The American Roller Bearing Co., Pittsburgh, Pa., have issued a new bulletin No. 1005, dealing with their type C roller bearings. These are the heavy duty and standard types, and first of all the characteristics of these bearings are gone into. The proper installation of the same is next discussed, after which several applications are shown in photographic and line drawing form. The specifications covering these bearings completes this interesting booklet, and to those interested in roller bearings, we feel sure it would prove of interest.

#### TOOL HOLDER CATALOGUE

The Canadian Production Tool Co., Ltd., Walkerville, Ont., have issued a very interesting catalogue dealing with their new line of tool steel tool holders. These tool holders are said to be able to use up scrap high speed steel of all sizes within their range, and even worn out drills are used as turning tools with success.

Various sizes and styles are made, these being shown in detail. Special tool holders are also illustrated, and in fact the 32 pages of this book is full of information to the man wishing to economize on his steel.

#### HELPS AND HINTS

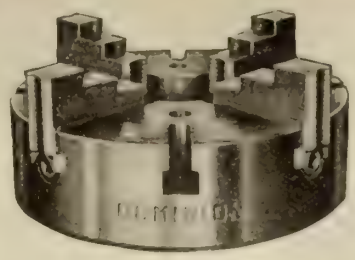
The British Aluminium Co., Ltd., with Canadian offices at 263-267 Adelaide St., Toronto, Canada, have issued four very useful booklets on aluminum. Booklet No. 1 contains hints and helps for foundry users of this metal, while booklet No. 2 is devoted to aluminum spinning and press work.

The third booklet covers this metal as used in machine shop practice, and the fourth volume speaks on the finishing processes sometimes put on this metal. These include cleaning, polishing, painting, coloring, etc. These booklets have been bound in fairly stiff covers and are made to fit the pocket, so that they should prove a ready reference to those interested.

#### COTTRELL PROCESS

The Western Precipitation Co., 1016 West 9th St., Los Angeles, Cal., have issued a catalogue dealing with their Cottrell processes of electrical precipitation of suspended particles from gases. First of all the history of electrical precipitation is given, after which the operation of the Cottrell precipitator is explained.

Next the construction of the same is discussed, after which a number of applications are shown in photographic form. Particulars of these installations are given, and to those interested in this process we can recommend a reading of the booklet which consists of some 32 pages.



#### INTERESTING DATA

F. H. Emra and partners, civil engineers, Central Chambers, Ottawa, have taken over the Canadian rights for various English machines, some of which have been forwarded for our attention. These take the form of two catalogues, the first of these being entitled "Mechanical Power Transmission."

This book deals with the Power Plant Co., Ltd., products of West Drayton, Middlesex, England, and is divided into several sections, the first of which is devoted to a talk about themselves and their facilities. Section two deals with double helical and other gears, and explains their unique method of manufacture.

The third section deals with photographic reproductions of interesting installations. Section four describes briefly the Sykes gear cutting machine, while section five discusses the use of their flexible couplings. Section six, which is the last, deals with the Mitchell type of thrust block, and states its employment in marine propulsion.

The second book deals exclusively, and more fully with the Sykes patent gear generating machine, and discusses how it was evolved, improved upon, and how one operator can now attend to three machines.

# DOMINION CHUCKS

STEEL OR CAST-IRON BODY
BUILT FOR HEAVY DUTY

## All Screws Are Reversible

SCREWS are made of the best grade steel. Both ends are broached and are heat treated after machining. They are reversible, so that either end may be used, are large enough in diameter to stand the torsional strains applied by operator when setting up his work. They are made to give the best service—and may be depended upon to stand up under the hardest usage.

DOMINION STEEL PRODUCTS CO. LIMITED

*Engineers • Manufacturers*

BRANTFORD, CANADA

#### MACHINE TOOL CATALOGUE

The St. Louis Machine Tool Co., St. Louis, Mo., have issued a catalogue, No. 16, which deals with their line of machine tools. This includes grinders of various types, polishing machines, tapping machines, tapping chucks, and safety collars and guards. Details are given regarding the various parts going to make up these machines, and some interesting data regarding grinders is given on the last page of this book.

#### DIAMOND STATE FIBRE

A handsome, substantially-bound new catalog, profusely illustrated and containing a summary of Diamond Fibre and its different uses, has just been issued by the Diamond State Fibre Company of Canada, Limited. This catalog should prove of interest to manufacturers, engineers and others who wish to keep abreast of improvements in raw material and the finished product.

#### STATIC ELECTRICITY.

Here is a peculiar case, where trouble arose from static electricity in a textile factory. The machine affected was a 15 horse-power motor fixed to a platform suspended from a wooden ceiling. The frame of the motor was not earthed, the only electrical connection being that of the leads. It was observed that flashing between the stator and rotor took place at intervals of from four to ten minutes, and on dry days was very pronounced. The motor was tested for ordinary faults, but nothing was found out of order. Finally, the flashing affected the stator insulation, and the motor was burned out. A spare motor was put into use immediately, but still there was the same amount of flashing. Then at last the frame of the machine was earthed, and the trouble ceased. Steps were next taken to devise a means of collecting and disposing of the static charge from the belt, when the trouble was completely overcome.

The American Society of Testing Materials have adopted as standard a test for determining the softening point of fire-clay brick, by comparison of test cones with standard Orton pyrometric cones heated in a suitable furnace.

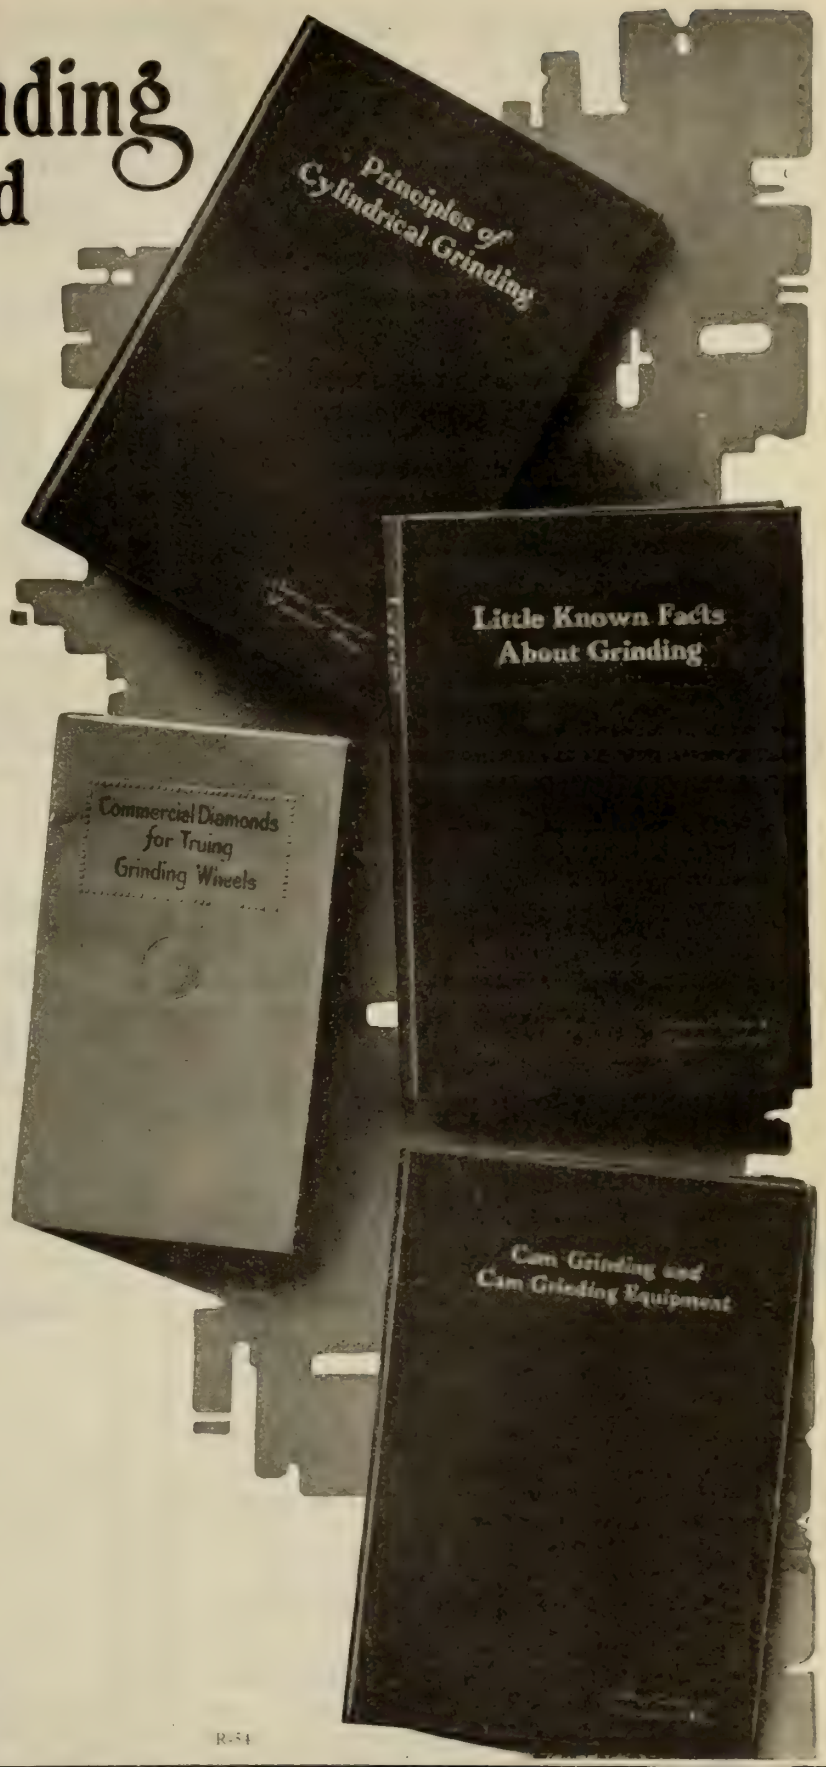
16. Principles of Cylindrical Grinding
17. Grits and Grinds (a monthly technical publication).

*We will be very glad to send on application any of these booklets which would be of special interest in your work.*



# Precision Grinding Principles and Experience

When C. H. Norton dictated the material published in "Principles of Cylindrical Grinding" he said it consisted of "valuable facts and directions suggested by long experience with cylindrical grinding."

Facts suggested by experience constitute an important part of Norton service—to both grinding wheel users and grinding machine users. They are facts which help cut down costs, increase production and get longer and better service out of Norton Wheels and Norton Machines.

If the Norton experience is worth anything to you, you are welcome to it. It covers a broad field. You can obtain only a small portion of it in booklet form, but it is part of a valuable assistance which is being rendered the grinding industry every day — assistance based on long experience.

Some of these booklets may interest you and help you. In case you are in need of the more profitable help of the practical men who have been gathering the experience, this branch of Norton Service is yours upon request.

STEEL CASTINGS

Steel Castings — Lithographed Ware
Galvanizing — Enamelled Signs
Wire Goods
Stoves

Made by the Acid Electric process up to fifteen tons. Castings made by this process are free from blow holes, easy to machine, and superior in every way to ordinary Steel Castings.
Castings supplied for shipbuilding, cars, locomotives, all classes of machinery, etc.

Head Office: Montreal. The Thos. Davidson Mfg. Co. Limited

Branches: Toronto and Winnipeg. Steel Foundry Division: Lachine Canal. Turcot.

*Meets all Demands for Speed and Accuracy!*

Aurora Drills

Are designed for rapid, accurate production. Furnished with geared power feed, back gear, tapping attachment, compound table and motor drive.

Stationary Head Sizes 20", 21".

Sliding Head Sizes 22", 44".

LANDIS

**No. 4-A**
Special Grinding Machine

Automobile, tractor, truck, and other gas engine parts can be rapidly and accurately reground on this No. 4A Landis Special Grinding Machine.

This machine is exceedingly versatile. It is designed and built especially for the small shop which has not a large volume of duplicate parts.

Any part of a gas engine which requires a grinding operation can be satisfactorily done on this Landis. Add this modern tool to your shop equipment for a profitable investment. Full details are yours for the asking.

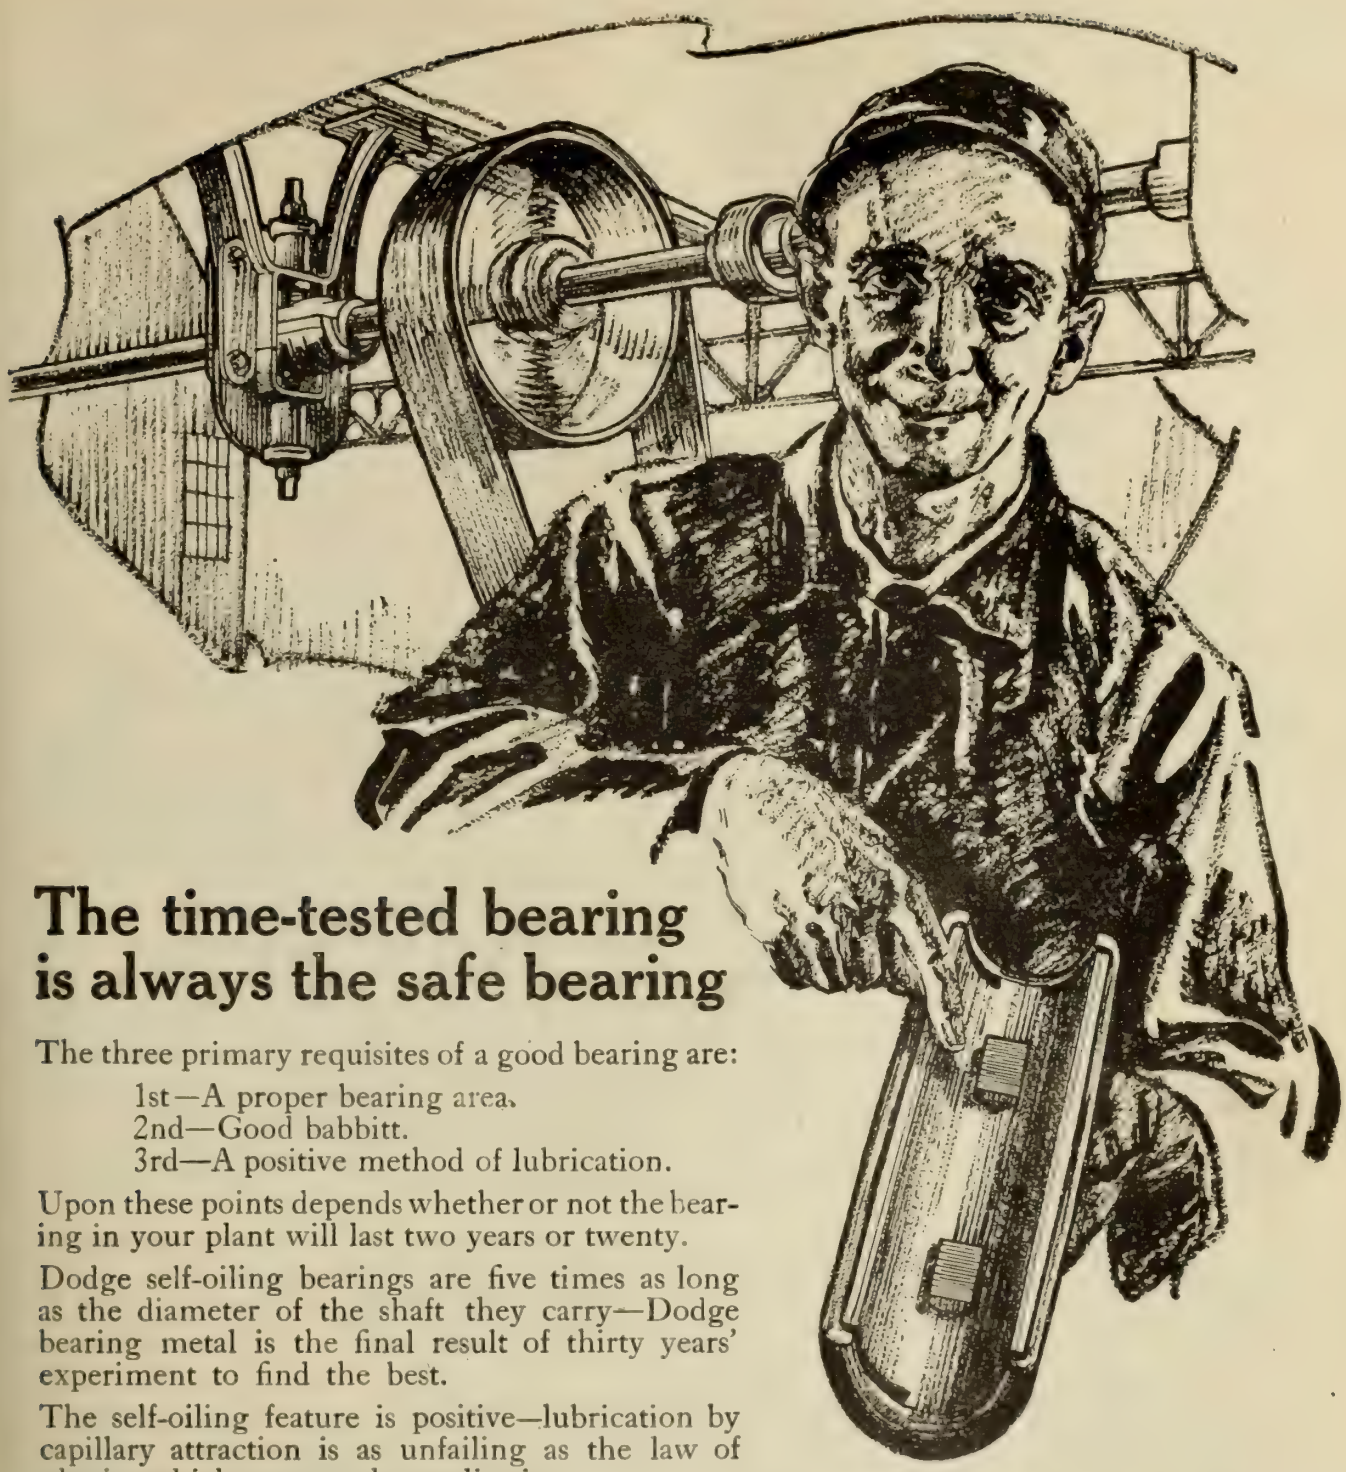
# HENDEY

## "Different Shapes and Sizes Which Are Seldom Duplicates"

This is what the Norton Company say of the work done on this Hendey 20-inch Crank Shaper. They use it exclusively for their special mold work.

The Machine Shop Foreman comments as follows: "We find that the Hendey Crank Shaper is a first class machine—very accurate and rigid.



"The micrometer adjustments, quick stop belt shifting device, and power feed are some of the features that are very valuable for our work."

Remember what users think of Hendeys when considering the installation of crank shapers, millers and lathes.

# The time-tested bearing is always the safe bearing

The three primary requisites of a good bearing are:

1st—A proper bearing area.
2nd—Good babbitt.
3rd—A positive method of lubrication.

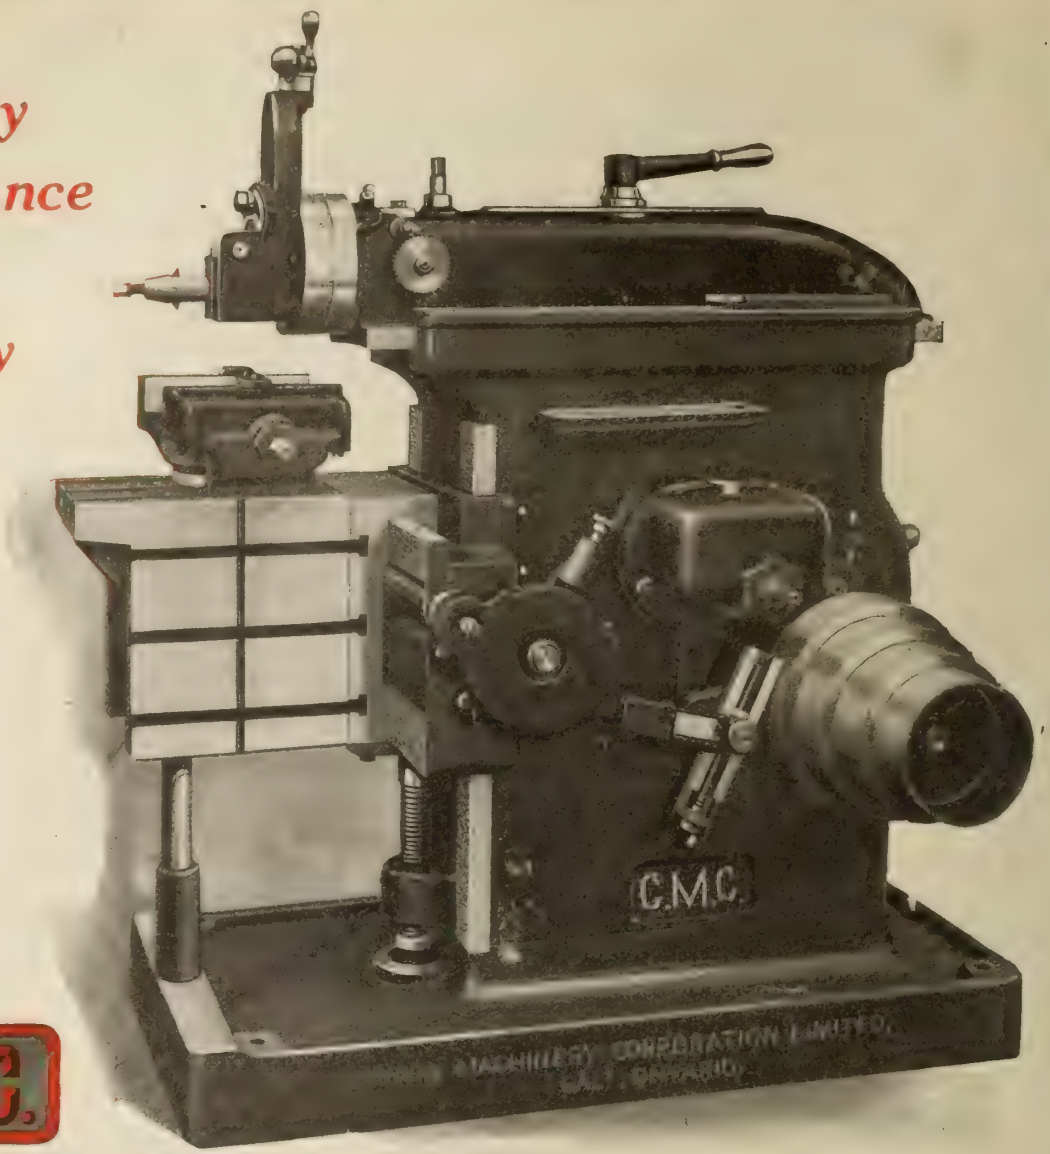
Upon these points depends whether or not the bearing in your plant will last two years or twenty.

Dodge self-oiling bearings are five times as long as the diameter of the shaft they carry—Dodge bearing metal is the final result of thirty years' experiment to find the best.

The self-oiling feature is positive—lubrication by capillary attraction is as unfailing as the law of physics which governs the application.

Dodge bearings are built for long, hard service; when shafts are properly aligned and installed they constitute the most economical and least troublesome "roadbed for power" possible.

**The capillary bearing is self-acting and needs but one filling of oil in each six months. Only clean oil reaches the shaft. The normal depreciation of this frictionless bearing will not exceed 2% per year. Can you find another lineshaft bearing that may boast as low an upkeep cost?**



**DODGE**

C.M.C.

# 16″ x 20″ Back Geared Crank Shaper

is accurate and speedy. It is a production tool of high order and is equipped with time and labor saving features such as power down feed to head, instantly reversible automatic cross feed, and adjustment to length of stroke by constant-reading stroke indicator while machine is in operation. This latter feature is very important as the stroke indicator shows at all times the exact stroke the Shaper is set for, whether in operation or not.

You can't help noticing the good qualities of

## Pratt & Whitney Taps

Their free cutting qualities, their extreme accuracy and their extraordinary ability to outlive others distinguish them.

The con-eccentric relief—a distinctive P & W feature—is the secret of their goodness. One-third of the cutting edge is concentric. The remaining two-thirds has eccentric relief. Taps can be sharpened at the only correct point on the face of the cutting edge. Sharpening in no way ... their size.

Yes, they cost a little more than some others, but they're well worth the difference. Carried in stock as are all other P & W Small Tools at our sales offices and agencies as listed.

**You know—every machinist knows—the material he is going to cut—but how many know what blade will do the work quickest, easiest, most economically?**

What blade should this man be using? **He's cutting Brass.** Look at the Starrett Hack Saw Chart, under the name of the material to be cut, and you find numbers 103 and 112.

If your hack saw frame will take a 12-inch blade use the No. 112 Saw. Why? Because it's a heavier, sturdier blade—and you can cut faster with it. If you use the No. 103, the only difference is that it's a thinner, narrower blade.

But whichever you use—always follow the Starrett Hack Saw Chart, and use Starrett Hacksaw Blades.

*Send for Catalog No. 22 "3" and a copy of the Chart*

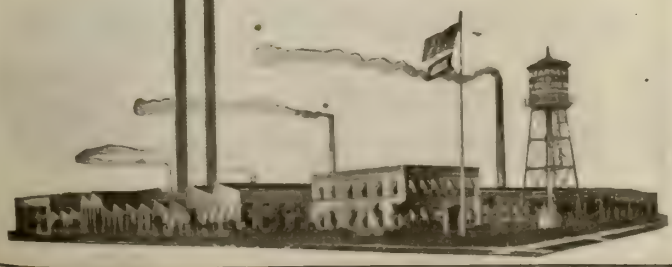
# MILWAUKEE MILLING MACHINES



Continuous milling of 10-inch adjustable wrenches on a Milwaukee Vertical Milling Machine. These parts are turned out at the rate of 3,000 a day and the finished surface bears a constant and accurate relation to other selected points on the part.

## *Rapid, Economical Milling*

Manufacturing milling by the continuous process is an advanced step in milling machine practice that is worthy of the serious consideration of the management of any plant. The motion in this milling process is continuous. It is reasonable, therefore, that in this way maximum production is secured. This sort of milling is most desirable in the machining of parts in large quantities. The rotary table with chucking fixture holding the work revolves, and the cutter is in operation and in the work at all times. The operator removes the finished piece and puts another unmilled one in its place.

Milwaukee Vertical Milling Machines are particularly well adapted to continuous milling. The spindle is adjustable for wear only as sufficient adjustment can be obtained by the adjustment of the knee alone, the same as it is in the horizontal type milling machines.

Have you any milling that would be well adapted to continuous milling? Let us help you.

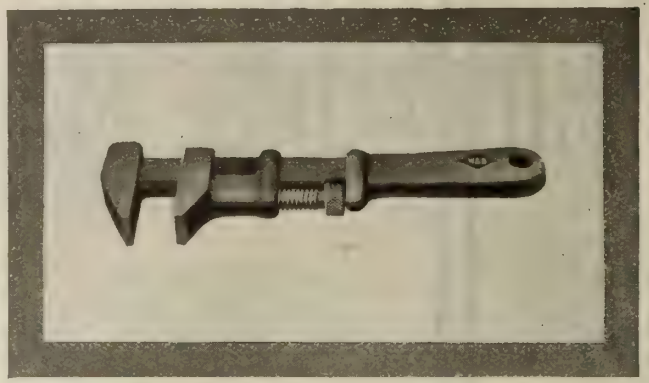
# A Handy Drill

## for the place that's hard to get at

Number 9
"Little David" Close Quarter Drill
will drive a 3 in. Twist Drill or a 2 in. Tap or Reamer.

"Little David" Close Quarter Drills will save you time and money for drilling, tapping, reaming, or running down nuts and studs in cramped places. They can be used right up against a lug or boss on a casting, or wherever space is scanty and ordinary pneumatic drills are of little use.

"Little Davids" contain less parts than used in other drills of this type, and, being simpler and more rugged, will last longer. Power is transmitted from the pistons to the spindle by three simple rocking levers, and as there are no chains, gearing, or other "frills," the air consumption is less than that of any other drill of equal size and power.



"I'd just as soon think of trying to get along without a socket wrench for my car as to do without my 'Little David' Close Quarter Drill," an enthusiastic user told us not long ago.

Made in two sizes.

"Little David" Close Quarter Drills are members of a family of Canadian built Pneumatic Tools. Write for Bulletins describing the entire line.

## A Book of Facts and Figures on FIRE BRICK

You should have this handy little reference book—costs **you nothing.** It gives valuable hints on how to get the best results from the fire brick you use in your furnace linings, cupolas, boiler arches and all fire brick masonry. In addition to this there are tables showing the number of brick required to make certain size linings, and comparison of various thermometer scales, circumference and areas of circles, in addition to weights of various materials.

**Let us have your name and address now, while you have it in mind.**

**ELK FIRE BRICK CO.**

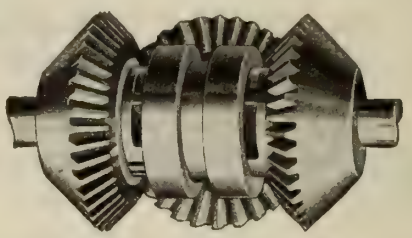
# THE JOHNSON FRICTION CLUTCH



## Clutches for Reversing Functions

Johnson Clutch Installation on Newton Milling Machine

A reversing clutch is a very common requirement on machinery, and one which is encountered in many different forms. Whatever the situation may be, a Johnson Clutch offers the best method of handling it.

The bevel gear assembly shown here is one of the ways in which a Johnson Double Clutch is frequently applied for reversing functions. Many of the best machine tools are equipped in this manner.

Double Clutch in Nest of Bevel Gears

# More Cam Shafts of a Better Grade

LANDIS design and performance is especially suited to rapid and accurate production.

The location of the master cam is directly over operating center. It is fully protected from water and grit.

The LANDIS has removed all chance from cam grinding by insuring precise adjustment and easy operation.

The makers of high-grade motors depend on the LANDIS.

You'll see why when you look up the details.

# USES and LIMITATIONS

of

## Car Type and Car-and-Ball Type Furnaces

W. S. ROCKWELL CO. INDUSTRIAL FURNACES NEW YORK

**are clearly defined in Bulletin 222-T**

Irregular heating of high charge in air furnace, showing tendency to overheat at the top and formation of cold zone (X) at bottom due to comparatively cold hearth.

Typical installations are shown to illustrate—

The applicability of car type and car-and-ball type furnaces to the heat-treatment of material that cannot be advantageously handled in other types of furnaces.

Factors governing selection of the type (car or car-and-ball) best suited to individual manufacturing requirements.

Difference in design of each type.

Influence of unequal cooling on the quality of finished product.

*In brief, this bulletin is a discussion of principles which will appeal to those interested in furnace design, loading and handling methods, heat generation and utilization, etc.*

# Carrying On By Marking Time

*By J. K. Munro*

HAY foot—straw foot—left foot—right foot—and never getting anywhere! That's J. K. Munro's view of the Parliament at Ottawa during March. Crerar and Lapointe are the only men who have really said anything, in "J. K.'s" opinion. After a survey of the Dominion Mr. Munro prophesies that there will be a Farmer Government, sure, in 1922—and probably supported by several French-Canadians.

And the Budget—"it is not likely," says Canada's leading political pundit, "that it will be a very sweeping document. It will likely provide for a sales tax of about one per cent, to make up the hundred million by which the estimates exceed the revenue, and the excess profits tax will likely be wiped out. That's about all."

## John Barleycorn and Jack Canuck

It's a hard question for the man-on-the-street to answer, How Dry is Canada? But Charles Christopher Jenkins has studied the question from all angles, and you will find his article extraordinarily informative and—in the light of Ontario's vote April 18—very timely.

**"For Sale For a Song."**
By Agnes C. Laut.

The question whether Oriental labor will solve some of our problems is here discussed.

**"From Ontario to Tin Pan Alley."**
By Geoffrey O'Hara.

A Canadian wrote "K-K-Katy" and also a song for Caruso. He tells how he won success.

**"The Drama of Our Great Forests."**
By Arthur Heming.

A further instalment of the artist-author's adventures with Oo-koo-hoo in Canada's primitive Northland.

**"As a Man to His Friend."**
By William Merriman Rouse.

A stirring story of the Ottawa Valley, of two lumberjacks, an actress and a barber.

**"Linen Sheets."**
By Alan Sullivan.

What do the occupants of an Old Woman's Home think of, as they wait for the "Reaper"? A poignant story with a surprise climax.

**"Pawned."**
By Frank L. Packard.

John Bruce recovers his strength, woos Claire Veniza—only to find her falling into Dr. Crang's clutches.

**"Why Have We Juvenile Crime?"**
By Ethel M. Chapman.

A timely account of Juvenile Delinquency and the Big Brother Movement.

# Says a Reader of Many Years Standing:

"I do feel that your paper is the most interesting and readable financial journal published in this country and, perhaps, in the entire North American Continent. Each week I somehow find time to read every word of it—mostly in bed, late at night. I find I have to read THE FINANCIAL POST in order to maintain myself properly abreast with the bigger things and movements taking place in this country."

THE FINANCIAL POST is published for men who are interested in big things—not necessarily men who personally have big financial interests at stake, but for men who are eager to know what is happening that will have a bearing on business and the well-being of Canada generally.

THE entire editorial organization of the MacLean Publishing Company is at hand to co-operate with the editors of THE FINANCIAL POST. Specialists in many businesses write for THE POST. A practical farmer, in constant touch with the farming conditions, deals with crop prospects.

THE POST is a paper edited by specialists for business specialists.

# *Good Times Just Ahead*

PROSPERITY is within our reach in Canada.

All we need to have and to hold it is a sane, sure grasp on its simple elements.

They are Industry, Integrity, and Faith.

These are the cardinal virtues of human relations. They are the underpinnings of healthy, natural business life and the foundation of a wholesome social system.

They are the fountainhead from which Progress springs. A well-known business economist has called them the "Fundamentals of Prosperity."

Your purchases are an expression of Faith. They are evidence of your Industry. Make them confidently from business institutions of Integrity.

Buying is the backbone of prosperity. An active market means more employment, steadier earnings; benefits are passed around.

Wise spending gives stability to earning and for that reason is farsighted thrift and sound economy.

The call of to-day is for cheerful thinking, willing working and constructive action by you—everybody—NOW.

To-morrow's change for the better will come about through the combined efforts of each and every one of us.

By sheer force of numbers and co-operation, by the high power of heart and mind, we can put Business on a firm, stable basis.

We can do this because all of the material factors making for better business are right.

Let us link our faith with industry, our vision with courage, and forge ahead.

Let's make an uncommon effort toward a common end — Good Times.

VOL. XXV. No. 13. March 31, 1921.

# *Efficient Fixtures used in Gear Cutting*

Holding Gear Blanks—Methods of testing truth of arbor and work—arbors and faceplates—holding gears with shanks—holding internal gears, also varied work.

*By Douglas T. Hamilton*

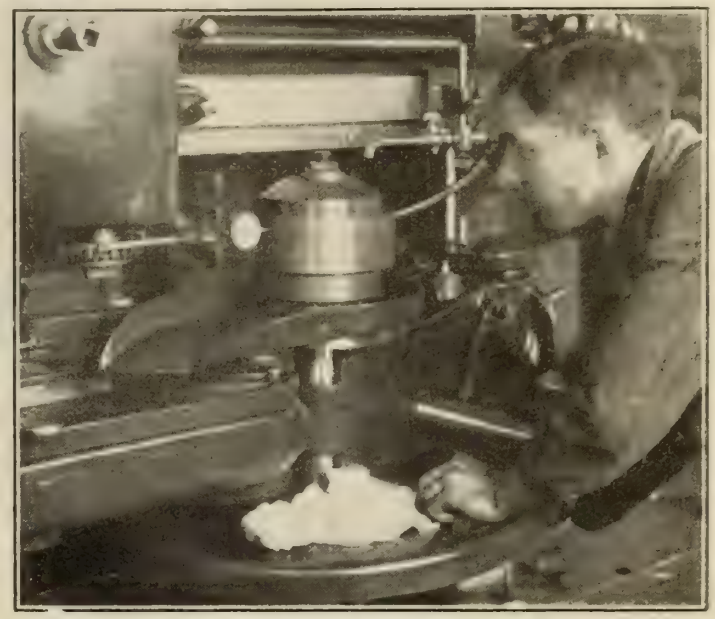

FIG 4. TESTING SQUARENESS OF SIDES WITH HOLE GEAR BLANSK CLAMPED IN PLACE

IN deciding on the best method of holding any particular piece of work when cutting gear teeth, there are certain necessary factors which must be considered. In the following we will enumerate a few of them:—the work must be so held that the teeth will be cut concentric with the hole in, or the shank on the gear. Slender gear blanks or those having thin walls, which are liable to spring out of shape should be very carefully clamped to hold them accurately. Internal gears should be held in some type of fixture, which will not distort the gear, and will hold it concentric while the teeth are being cut. A large number of gear blanks should not be held on an arbor at one time, unless the sides are absolutely square with the holes—this point will be dealt with more fully later. The work-arbor should run absolutely true, as is also true of face-plates against which the work is clamped.

### Holding Gear Blanks

Bearing these points in mind, we will now explain how work can be accurately and satisfactorily held on the Fellows gear shaper, but before doing so it might be advisable to explain briefly the principle of this machine, and its peculiar features relative to the holding and cutting of gears.

Fig. 1 shows a section through the work-spindle of the Fellows gear shaper, and illustrates the construction

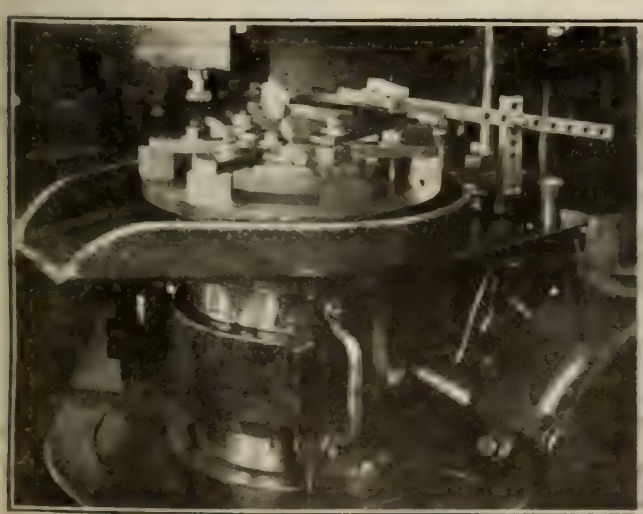

FIG 11—SHOWING UNIVERSAL APPLICATION OF A FACE-PLATE TYPE OF FIXTURE ON THE GEAR SHAPER.

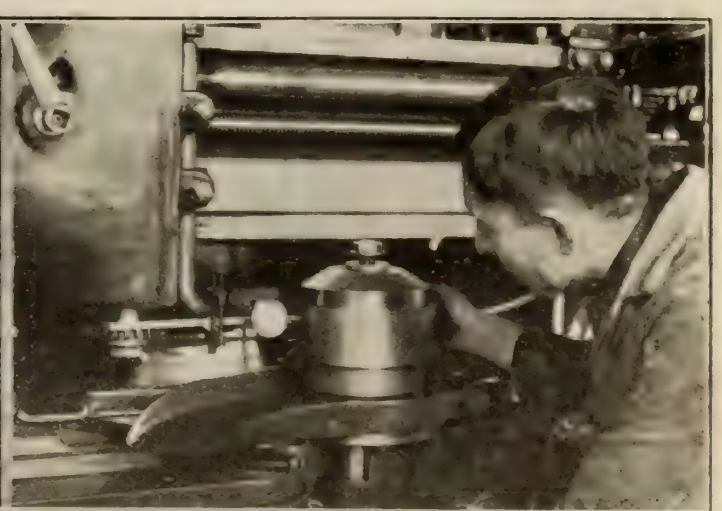

FIG. 3—TESTING TRUTH OF EXTERNAL SURFACE OF GEAR BLANKS WITH HOLE.

of this spindle, as well as the type of standard work-arbor used. It will be noticed in this case that the spindle has a removable inserted tapered sleeve in which the standard work-arbor fits. This standard work-arbor differs from most work-arbors used in gear cutting machines, in that it has a reverse taper and the tighter the work is clamped to the face of the work-spindle, the tighter this work-arbor is held in the sleeve, so that all members, arbor, work, etc., are bound together as a solid unit. The work can therefore be cut either on the "push" or "pull" stroke of the cutter, the "pull" stroke generally being recommended for ordinary gear blanks, because the work-support, as shown in Fig. 1, can be brought into play to prevent any distortion of the work-arbor, while the teeth are being cut.

### Methods of Testing Truth of Arbor and Work

There are certain preliminary operations which must be carefully handled prior to the cutting of a gear on the gear shaper. The first and most important one is to see that the arbor and work-spindle sleeve are perfectly clean. Then the work-arbor should be inserted in the sleeve from the botom, and tested for truth by means of a dial test indicator, as illustrated in Fig. 2. If the arbor is found to be out of truth, it is possible that a slight amount of dirt has collected in the work-spindle sleeve. The arbor should be removed, and the arbor and the sleeve carefully cleaned.

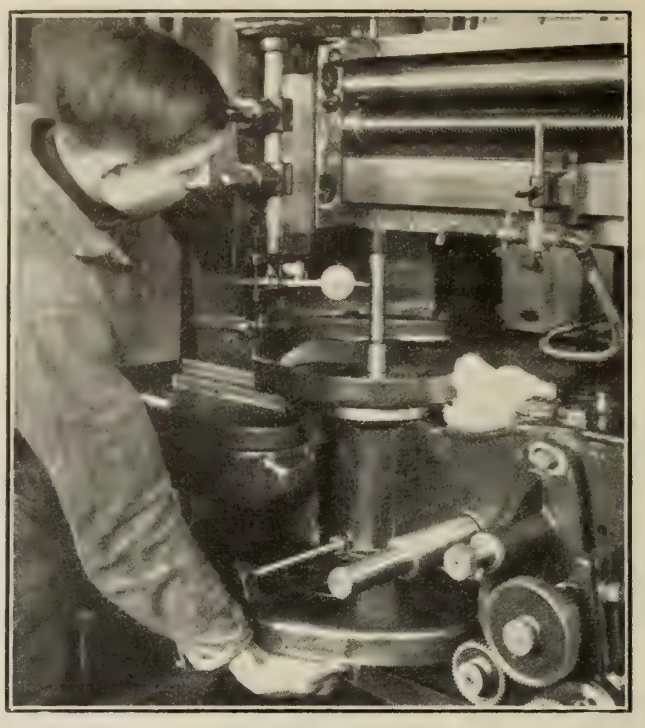

FIG. 2—TESTING TRUTH OF WORK-ARBOR WITH A DIAL INDICATOR.

The next step is to test the gear blanks themselves. If the work-arbor has been found to run true, the gear blanks, as shown in Fig. 3, are placed on the work-arbor and the nut left untightened. The dial test indicator is now brought in contact with the circumference of the work, and the work rotated on the work-arbor to determine if the holes in the gear blanks are concentric with the external circumference. If the gear blanks are found to be concentric, the nut is tightened and the test shown in Fig. 4 is then made. This consists in testing the gear blanks for truth of the holes with the sides. If the sides of the gear blanks have not been squared with the holes, the gear blanks will distort the arbor out of its true vertical plane, and if after the test in Fig. 4, the work is found to run out more than in test Fig. 3, it is a clear indication that the sides have not been faced square with the holes. If this difference in eccentricity exceeds the manufacturing tolerances on the work, the gear blanks should be removed and refaced; otherwise, the teeth will not be cut concentric with the holes in the gear blanks.

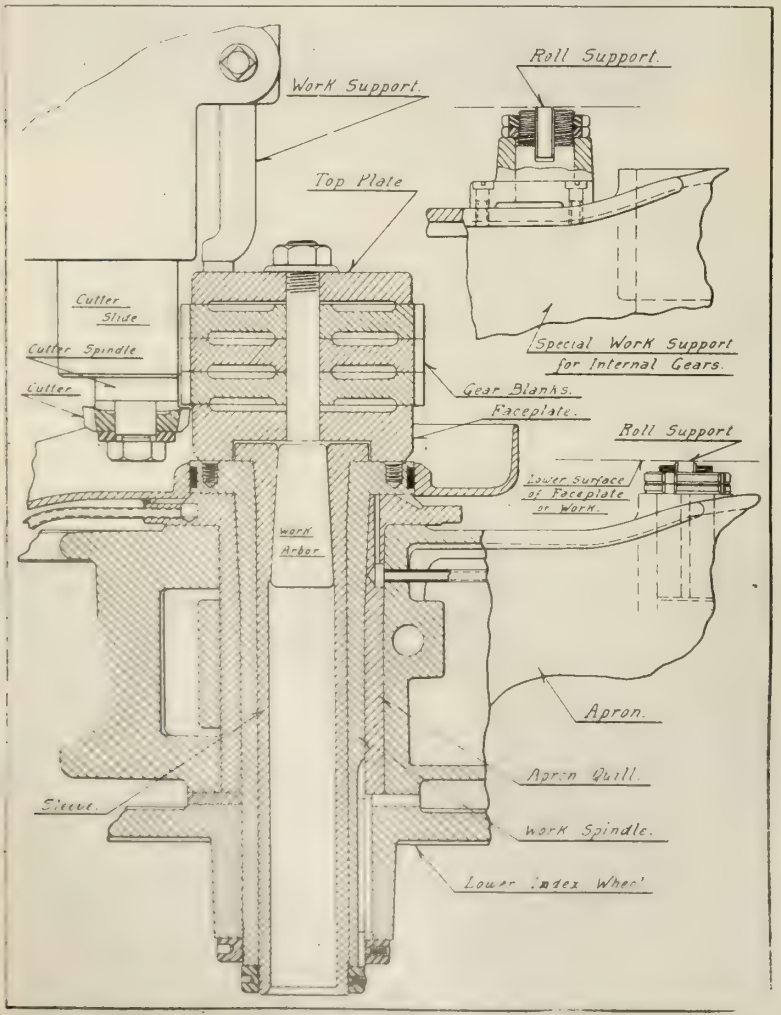

FIG. 1—SECTION THROUGH GEAR SHAPER WORK-SPINDLE AND APRON SHOWING REVERSE TAPER WORK-ARBOR AND METHOD OF HOLDING AND CLAMPING GEAR BLANKS

### Arbors and Faceplates

Under no condition should a soft work-arbor be used. The arbor should either be made from machinery steel pack-hardened and ground, or from tool steel hardened and ground. A good pack-hardened machinery steel arbor is satisfactory. If the bushings are used, care should be taken to see that they are true, and it is preferable to grind them. They need not be hardened unless there is a large number of gears to

cut. All washers or faceplates used for supporting gear blanks should be kept true and faced off evenly either on a grinding machine or on a lathe, to insure that the faces are square with the holes. Gear blanks that have been found to be inaccurately machined should be corrected before the teeth are cut. This is especially necessary if it is found that the faces of the rims are not true with the holes.

Experience has shown that money spent for first-class equipment for holding gear blanks, and for keeping them to a high standard is money well spent. If the work is handled under the right conditions, elaborate inspection of gear blanks after cutting is not necessary.

### Methods of Holding Various Forms of Gear Blanks

Some of the principles previously explained in connection with the holding of gear blanks will be further illustrated by means of examples. Fig. 1 shows how an ordinary plain gear blank, either with or without arms, can be satisfactorily held. The work should rest on a faceplate, and have a faceplate on top of it, so that the members can be clamped together and the work-supports used.

Fig. 5 shows how a small pinion is held. In this particular case, the faceplate is dispensed with, the work-arbor itself acting as one. The arbor is held up in the sleeve by a nut because the shape of the work necessitates operating the cutter on the "push" stroke. The thrust, therefore, comes on this nut located on top of the work-spindle. As the work has a tapered hole, a washer is used. This practice is better than using a tapered arbor, as the bushing is much easier and cheaper to make, and can be easily renewed. This is a very simple but effective fixture.

Fig. 6 shows how a two-step gear is held. It will be noticed here at A that the lower face-plate is recessed to clear the hub on the gear blank, and supports the latter close to the rim. The clamping plate is also recessed to clear the other end of the gear blank.

This is a comparatively simple fixture and if accurately machined will produce exceptionally good work. The hole in this gear blank is square, necessitating the use of a bushing on the work-arbor. For cutting the small gear, the fixture shown at B is used, and consists simply of two plain washers. The gear blank rests on a washer located on top of the sleeve in the work spindle and is clamped in place by a top washer and nut. Owing to the shape of the work, a cutter spindle extension and thin-web cutter are necessary.

### Holding Gears Having Shanks

One principle that should be adhered to in the holding of gear blanks is that as far as possible they should be located from the same points that are used when the member is assembled in the finished product. Holding work on centers should be dispensed with, because seldom if ever is the work held on centers when in actual use. The work should be supported in exactly the same manner as when in actual use; and this, of course, with accurate fixtures, eliminates the possibility of eccentricity, which is one of the chief causes of noisy gears.

Fig. 7 shows an interesting type of fixture for holding a pinion having a bearing on both ends. It will be noticed here that the work-arbor is of special shape, and is used to center a floating fixture, this floating fixture being clamped directly to the top face of the work-spindle. At the upper end, the work is supported by a special supporting arm. This is held on the apron of the machine, and surrounds the work-spindle taking the place of the regular chip-pan. It comprises a main fixture and two locating studs, one at the rear end of the arm and the other in the centre. The latter is provided at its lower end with rack teeth so that the supporting arm can be elevated to remove the work. This arrangement provides a very accurate and efficient means of holding small pinions which have a shank on both ends.

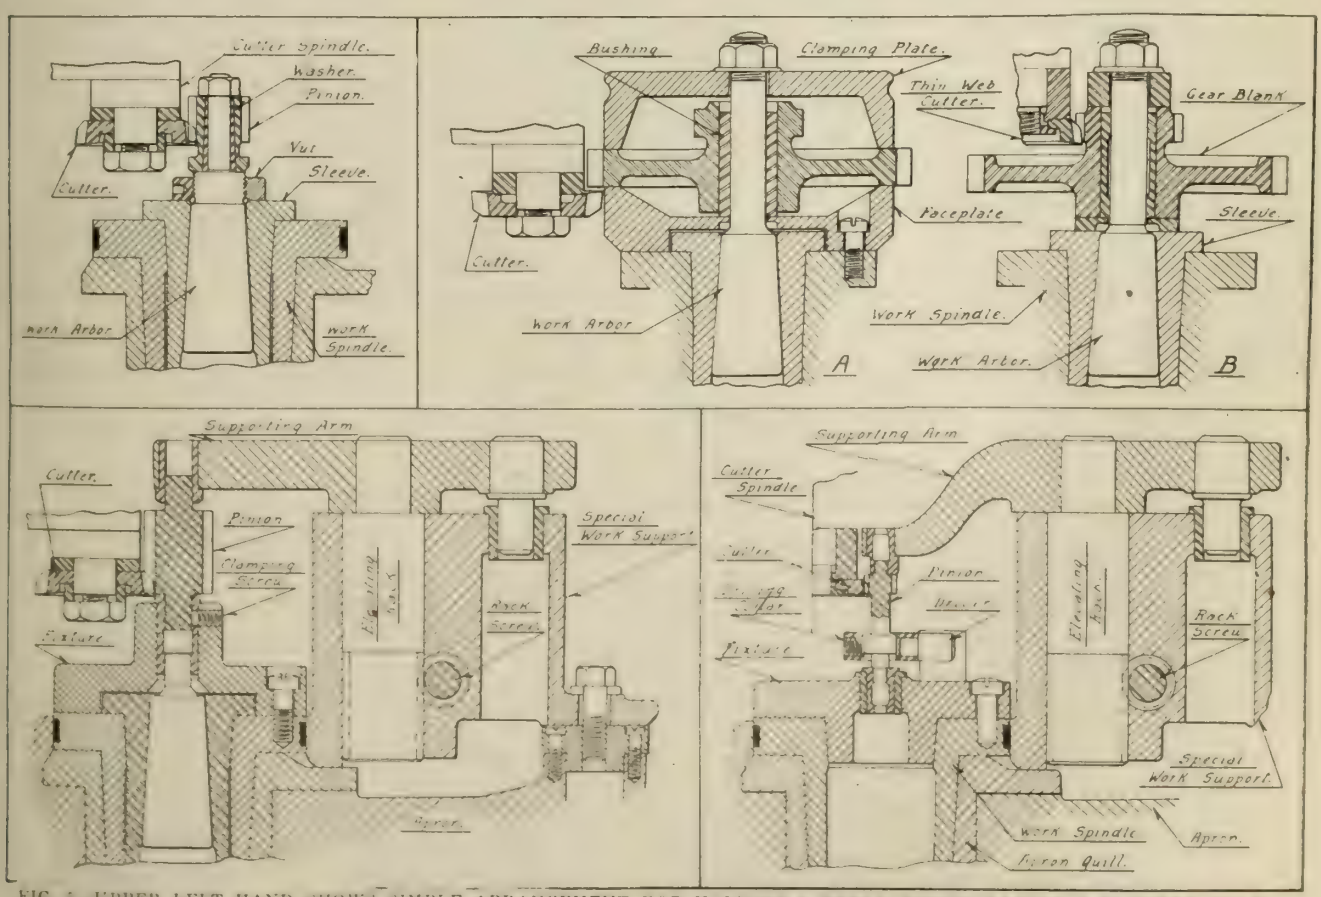

FIG. 5 UPPER LEFT HAND SHOWS SIMPLE ARRANGEMENT FOR HOLDING A SMALL PINION HAVING A TAPERED HOLE.
FIG. 6 UPPER RIGHT HAND SHOWS METHOD OF HOLDING A TWO-STEP GEAR FOR CUTTING TEETH ON SMALL AND LARGE STEPS
FIG. 7 LOWER LEFT, ILLUSTRATES A SPECIAL FIXTURE FOR HOLDING A PINION HAVING A SHANK ON BOTH ENDS
FIG. 8 LOWER RIGHT SHOWS A SOMEWHAT SIMILAR FIXTURE TO FIG. 7, WITH THE EXCEPTION THAT THE PINION IS SMALLER AND THE WORK IS DRIVEN IN A DIFFERENT MANNER.

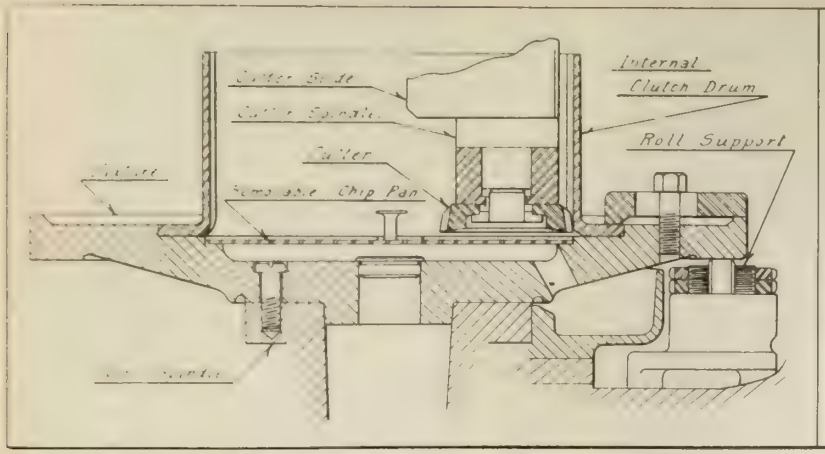

FIG. 9—CUTTING AN INTERNAL GEAR CLUTCH HOUSING.

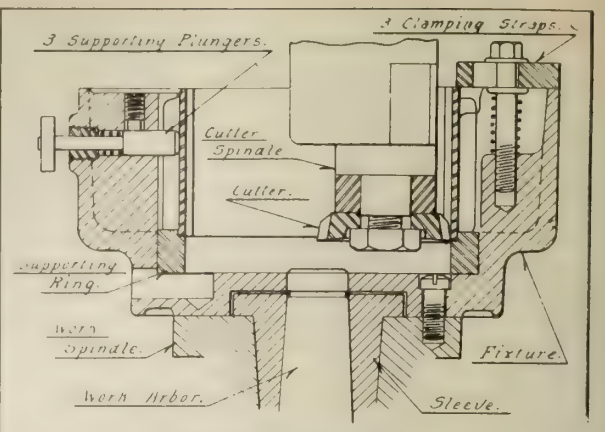

FIG. 10—A POT-TYPE FIXTURE FOR CUTTING A THIN-WALL INTERNAL GEAR.

A slightly different arrangement is shown in Fig 8, where the pinion is much smaller. In this particular case, a floating fixture is used, and the work-arbor is dispensed with. In setting up, the work is clamped, and then trued up by means of an indicator, after which the fixture is clamped in position. At the upper end, the work is supported by an arm held on a fixture similar to that shown in Fig. 7, but owing to the shortness of the work, a special over-arm support is necessary. In this particular case the work is driven by a dog which is clamped to the work itself and fits into a slot cut in a projection on the fixture.

**Holding Internal Gears**

Internal gears in many cases present difficult holding propositions, and especially when the internal gear has a considerably long face and a comparatively thin wall, such as is the case with clutch housings and similar work. If the clutch housing shell is heavy enough, then a fixture of the type shown in Fig. 9 can be used with satisfaction. This is a very simple fixture and is easily made. It comprises a faceplate, which is centered by the work-spindle itself, and is also clamped to it. The roll support on the apron, which is a standard appliance on the gear shaper, provides additional support for the fixture. A seat on the fixture is machined to fit the work, and the latter is held in place by means of three clamping straps. The work, aside from this support at the bottom, is not supported against the deflecting action of the cutter. The gear shaper, owing to the fact that the forward face of the cutter is provided with a clearance angle, exerts very little outward thrust, so that in this particular case, further support for the work is unnecessary.

An internal gear having a thinner wall is illustrated in Fig. 10. Here the wall of the gear is too thin to resist the outward thrust of the cutter, and therefore, a pot-type of fixture is necessary. This carries four spring plungers, which are locked after the work is clamped; thus serving to resist the thrust of the cutter against the work. Three clamping straps operating against the top face of the work are used to hold the work against the hardened steel ring in the fixture itself. This fixture differs from the other in that it is centered by the work arbor instead of the work-spindle; but it is clamped to the work-spindle in a similar manner.

**A Universal Fixture**

An exclusive advantage of the gear shaper method is shown in Fig. 11. Owing to the arrangement of the work-spindle which is carried on an apron that can be swung clear from the machine, the work can be clamped and held on a faceplate in a similar manner to a lathe. It can also be trued up accurately by means of a dial test indicator. This is illustrated very clearly in Fig. 11, which shows the cutting of an internal gear on the gear shaper without the use of a fixture, except an ordinary faceplate and locating ring, for centering work, the work being held by clamping straps as illustrated. This method of holding work is of great advantage in a jobbing shop.

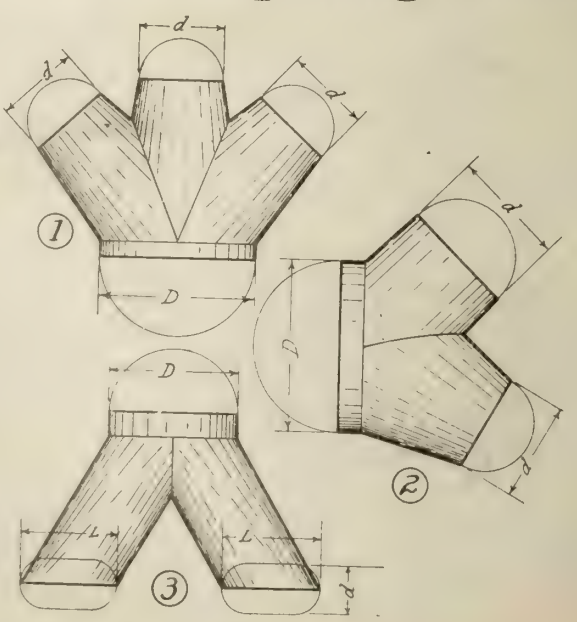
# *Pipe Capacity—Relative Sizes of Opening Areas*

In heating and ventilation, water or air distribution it is often necessary for feeders to be taken from the main header, or vice versa. The combined cross sectional areas of the branches should equal that of the main line. Areas of circles vary as the squares of their diameters.

1—Three equal branches leading from one main. 2—Two feeders in ratio of 3:2 leading from main. 3—Two elongated sections leading from round main. Suppose main pipe D in cases 1 and 2 to be 15 ins. diameter. Area of large opening equals 15 inches squared x .7854″ = 176.715 sq. in.

1—Area of one small pipe equals 176.715 ÷ 3 = 58.905 sq. in.

Diameter (d) equals 8.66 inches.



2—Ratio of branches 3 : 2.

$$\text{Area of large branch} = \frac{3}{5} \text{ of } 176.715'' = 106.03 \text{ sq. in.}$$

$$\text{Dia. of large branch} = \sqrt{\left(\frac{A}{.7854}\right)} = 11.62 \text{ inches.}$$

$$\text{Area of small branch} = \frac{2}{5} \text{ of } 176.715'' = 70.68 \text{ sq. in.}$$

$$\text{Dia. of small branch} = \sqrt{\left(\frac{A}{.7854}\right)} = 9.48 \text{ inches.}$$

*Canadian Machinery.*

# It's Often the Simple Idea that Saves the Time

## A Milling Problem—A Planer Kink—A Simple Calculation—A Portable Polisher, Two Punch Press Ideas, and a Simple Yet Effective Fixture.

By DONALD A. HAMPSON, Member A.S.M.E.

A DIFFICULT milling job is depicted at Fig. 1. We had to cut out the notches A-A on the pieces shown to the left of this view, and the parts were of drawn steel, ¼ inch thick, and having a section about ¾ inch wide left between the notches. To turn them out in manufacturing time, forty-eight were placed in a holder, this in turn clamped in a milling fixture, and the work passed between two straddle mills. The operator burred the work and loaded a spare holder while the machine was running.

The machine was in first-class condition, the fixtures well made, but we could not get the pieces to measure closer than 0.002 inch and this was too much off to pass—the particular measurement being from the bottom to the notch. A part of this variation was due to inaccuracy in the steel but most of it came from the work being unevenly clamped. We used a bar of steel like the one in Fig. 1 for a clamp over the work. We tried these clamps thick and stiff, and we tried them thinner, with an additional screw in the centre—but the work varied just the same.

Not until we adopted the scheme illustrated did we have success. A dovetail slot was planed the full length on the under side, and in this slot was driven a filler of maple cut across the grain. When wedged full, the clamp was put on the planer and the wood surface machined off true with the back and straight. This insert seemed to have the necessary qualities, for the accuracy, after its use, was all that could be desired.

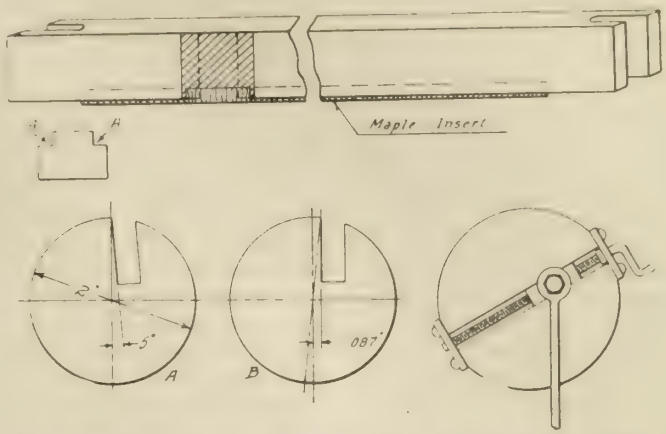


FIG. 1 UPPER VIEW. FIG. 2 LOWER RIGHT HAND VIEW. FIG. 3 LOWER LEFT HAND VIEW.

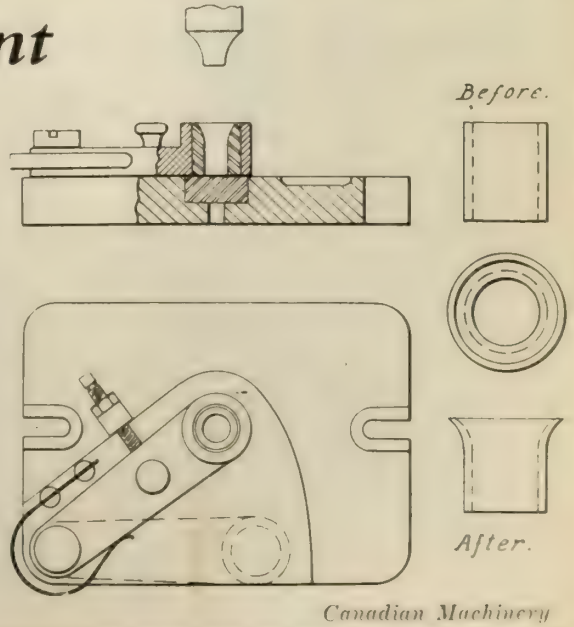
### A Planer Kink

Many old planers have the feed driven by a rod set in the flange on the stub end of a half-turn shaft. Means of adjusting the amount of feed are provided by the slot in the flange, along which the rod may be set by shifting the bolt.

The time lost in setting this bolt, getting it too far or not far enough, and in guessing at the proper place, then leaving it at the wrong one because it is an effort to change—that lost time would pay for the alteration shown at Fig. 2 in the first month. Flat plates are screwed across the ends of the slots, a screw is turned up and one end bent to the form of a crank, and a nut is made to slide in the T slot. This change makes feed shifting as easy as on any modern tool. Adjusting can be done while the machine is running and the various increments of feed secured both positively and quickly.



### Another Story

Some cutter blanks were sent in from a nearby shop to have the slots milled, these to be milled so that the cutting edge of the tool should lie at an angle of 5 degrees with the diameter, as shown at Fig. 3-A. The machinist to whom the job was given laid out the angle on the end of one piece and set

# *Punch Press Attachment*

The drawing herewith illustrates a safety device fitted to a die for the protection of the operator when placing the work in position. The operation is the flaring of the small tube as shown. The tubes are first cut off in the automatic from three-quarter inch by one-half inch steel, and then bell mouthed in the punch press. Instead of the operator placing them against the guide and holding with his fingers, we arranged the swinging arm shown. This arm consists of a piece of steel pivoted at the left hand end, and with a bell mouthed container at the other. A tension spring kept the arm against an adjustable stop, which aligned the work beneath the punch. The operator pulled the arm back as the ram ascended and his hands were never in the danger zone.

*By D. A. Hampson*

*Canadian Machinery*

up the piece on centres, intending to line it up with a square from the table top. Its position then would be as shown at B. He found, however, that he could not reach his scribed line when set up. He next asked for help to determine the distance between the arrows in the figure, as his idea was to set the side of his cutter to an arbor on the centres, then move with the aid of the dials.

Actually, he could have made the calculation himself, but it was easier to ask than to think it out, so, like many others, he lost a chance to apply a bit of his education to everyday work. The desired distance, the side of the cut, and the diameter, form the three sides of a triangle in which the unknown distance in the "side opposite" and half the diameter is the "hypotenuse." This, when the angle is known, forms one of the simplest of trigonomic equations. The sine of the angle is .087. The equation is SO = Hyp. x sin., which in this case may be solved mentally 1 x .087 = 0.087 inch. This is the distance off centre when the line of cut is placed vertically.

### A Simple Idea

One of the workmen from the foundry appeared in the shop unexpectedly with a miniature electric motor, a discarded brush that his foreman had given him and a drawing. He said he had been studying on an idea and would like to get a little machine work done for himself at the usual shop rates. It was a shop policy to encourage any of the men who would think along mechanical lines and this fellow's job was put through the same day. The idea was that of an electrical stove polisher, in fact a scheme to lighten the housewife's labor, and while doing so to shine the stove without the use of polish, adding another to the long list of devices that have revolutionized our homes in the past decade or two.

Fig. 4 shows that the device is very similar to the light portable grinders, extensions of the motor shaft carrying the "abrasive wheel" and the two handles. In this case, a section of a wire brush worn down to five inches in diameter formed the working tool. This was brought in contact with the top of the stove and there moved about at will. No preparation was used. Our man's theory was that cast iron has in its composition practically the same elements that form the basis of stove polishes. The results he got were proof that he was right. His revolving brush removes the rust and dirt from the surface and further metal-to-metal contact burnishes the iron, which supplies its own graphite polish, so to speak.

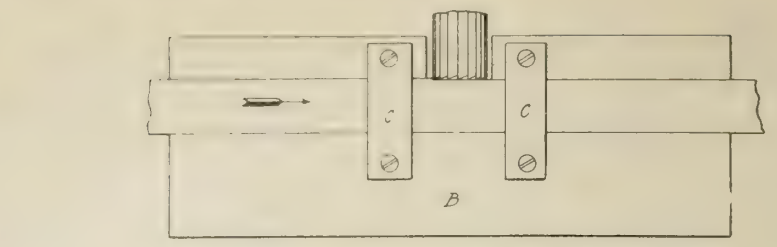


FIG. 5—FIXTURE FOR REDUCING EDGE OF BARS.

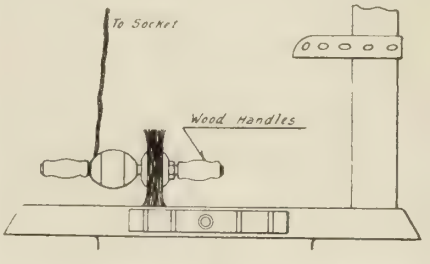

FIG. 4 SHOWING STYLE OF STOVE POLISHER.

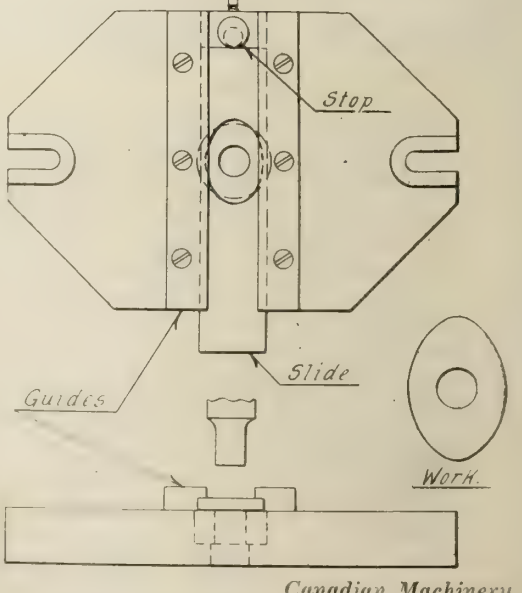

A certain shop manufactures nearly a million pieces per year from rectangular cold drawn steel bars. Various kinds of vises hold the bars, which are placed a number at a time in milling machines, and cut off. Frequently it is possible to do some forming along with the cutting off. Ordinarily, the shop's stock of steel includes all the sizes needed, but conditions such as have existed during recent years and the "specials" that have to be made for large buyers sometimes require steel of a size that is not obtainable. The only way to get it is to cut down the next larger size.

Fig. 5 shows a fixture used for reducing the edge of bars a few thousandths. For instance, steel .873 inch x .183 inch would be in stock and this would be the nearest to make a thousand pieces .870 inch x .183 inch from. If there wasn't a fixture for cutting to this size, the cost of one of the type shown is a mere trifle. B is a piece of cast iron planed top and bottom with a tongue on the bottom to fit the miller table. When bolted to the table, a slot is milled, .184 inch deep and .870 inch wide. The left hand end is widened to .873 inch. The two straps C fasten over the slot to confine the bars. A new bar is pushed in at the left hand end, an end mill removes the excess at high speed and the bar passes out at the right hand end the required size.

# *Punch Press Feeding Device*

We were always fortunate in the matter of punch press accidents and wanted to remain so. Safety devices applied to old and new tools are profitable expenditures. The oval piece here shown is of 1-16 inch brass. The operation is to punch the center hole. The die is set in the die block and the top is provided with two strips for guiding the slide which carries the work. When placing in the work the strip is pulled out, and then pushed in below the punch. When the hole is punched, the slide is pulled out far enough to allow the work to drop out into a box located below the press bed. In addition to this safety arrangement the press is provided with a guard, but as the hands of the operator never go near the punch, the guard is only an added protection.

# Typical Examples of Manufacturing Lathe Work

*By J. H. Moore*

THE modern machine tool of to-day is a very different tool from its prototype of ten years ago. Wonderful improvements have been made until we now have automatic millers, automatic screw machines, automatic lathes—but why go further; every up-to-date mechanic knows the rest off by heart.

There comes a time, however, when a problem arises that the automatic cannot economically solve. True, the automatic type of machine is ideal when large quantities are put through at a time, but how about the shop not quite big enough for that, where the work goes through in lots not large enough to justify the installation of special automatic machinery. Are they to be content with ordinary production, or can they obtain a higher rate of production without quite so much expenditure?

That question is easily solved by looking through the advertising pages of any modern technical journal. In such pages will be found all types of machines that are medium steps, so to speak, in increased production. These steps may, of course, lead to the point where increase of business calls for a still further expenditure in equipment, but let us leave the possibility at this point and consider the use of the manufacturing lathe as a productive measure.

There are, of course, numerous manufacturing lathes of various designs on the market, each claiming some particular feature or features. We will, however, not attempt to even touch upon these points, but rather let this article be a lesson on a few examples of the possibilities of such a machine tool. Through the courtesy of the Lodge and Shipley Co., Cincinnati, Ohio, we are able to show in photographic form some work completed on their particular type of manufacturing lathe.

The main idea embodied in the design of such machines is this: to retain the simplicity of the general purpose engine lathe, at the same time adding attachments which will make the machine accomplish repetition work. For example, multiple positive diameter stops, automatic length feed stops, special tool blocks, and so on.

Take the use of the stops. In the first case the diameter stops allow repetition work of certain sizes, while the length stops guarantee that the feed trips at the same point in each case. The value of special and multiple tool blocks is readily understood, for by their use it is possible to group the cutting tools for productive purposes.

Without going into the design of such machines let us consider a few examples of work performed. At Fig. 1 is shown the machinery of a shaft such as could be found in almost any manufacturing plant. The piece shown is the main driving shaft for a selective headstock, and the operation-times given include handling, setting up, etc. This piece was machined to demonstrate the difference in machining time possible, and for the sake of comparison ten pieces were machined under three conditions. The diameter and length stops were both used at the first test, and the time for the ten pieces was 1 hour 56 minutes or an average of 12 minutes each.

In the second test the diameter stops only were used, and in this case 3 hours 4 minutes or 18 minutes each was necessary to complete the ten pieces.

The third and last test was accomplished without the use of either the length or diameter stops, and 4 hours and 3 minutes was necessary to complete the ten pieces. This meant that the average time for each piece was 24 minutes. It would be well to add that the work was accomplished on the same lathe by the same operator, under the same conditions, the test being held to demonstrate the efficiency of the stops. From a glance at the time figures it will be seen that production increased 100 per cent.

### Another Example

Fig. 2 shows a rather interesting piece which if it was to be made in sufficient quantities would no doubt be produced on an automatic screw machine, or some such production tool. However, in this case the lots were limited, so that it was made on a manufacturing lathe. The work is known as the turning of selective head main driving shaft beading nuts, and the work is done at one setting from large bar stock, leaving the bar stock in the centre intact. This was accomplished on an 18″ machine, and the tool set up consisted of an L-tool, threading tool, cut-off tool, and finishing tool, in a four-way tool block. A facing tool was also held in a high duty tool block.

The operations consisted of the following steps. The stock was first turned on the outside with the finishing tool, after which the outside of stock was threaded with the threading tool. Next came the cutting under ring with the

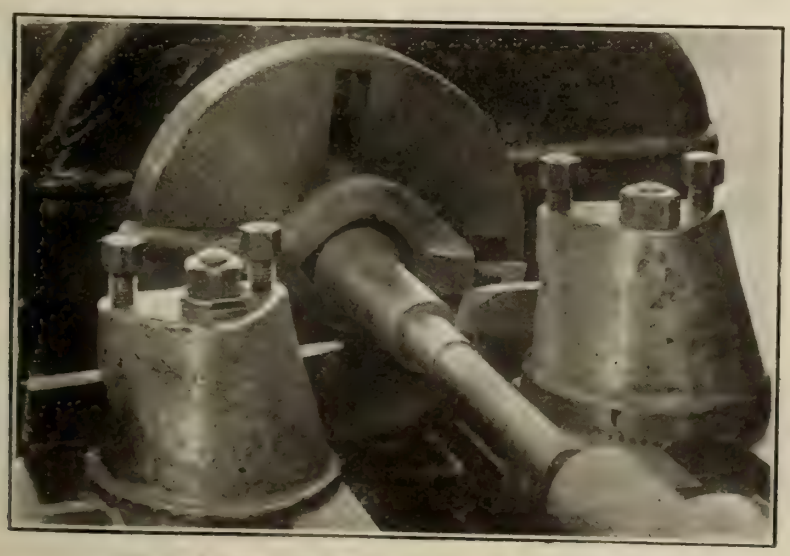

FIG. 1. A GOOD EXAMPLE OF SHAFT TURNING.

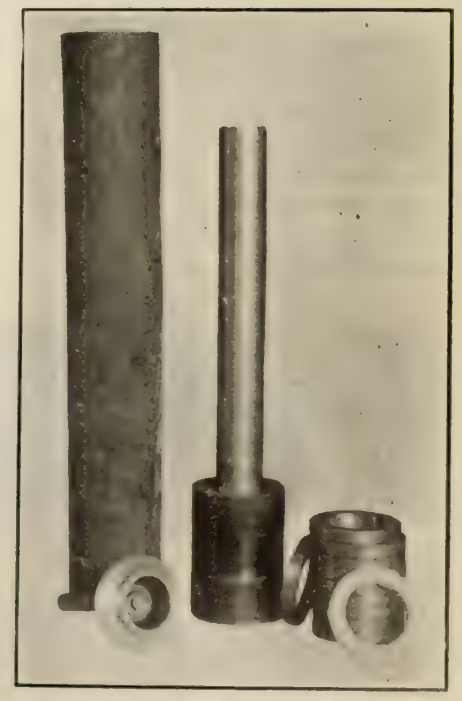

FIG. 2. SHOWING THE ROUGH STOCK AND FINISHED PIECES.

L-tool, leaving the bar stock in the centre intact.

The fourth step consisted in facing off the end of ring with the tool in the rear rest. In the fifth step, the cut-off tool in the four-way tool block, and the facing tool on the rear rest are set so that when the fourth step is finished the cut-off tool when run forward will cut off the ring to its proper thickness.

The sixth step consists of running in the cut off ⅛", revolving the swing threading tool into position, and the chamfering of both outer edges of the ring. The next and last step consists of finishing with the cutting-off tool. It will be noted that the photograph shows the testing plug, samples of the work, and both the rough stock, and the appearance of same after the nuts have been made.

Fig. 3 illustrates a close-up view of the L-tool cutting under ring, while Fig. 4 illustrates the turning of rings in the third operation.

### Two Other Examples

Fig. 5 depicts a rather interesting job being performed. The work is that of turning a double bevel gear, and the value of multiple tooling is very evident in this view. In the first operation a four-way tool block is used on the front rest, while the gang tool block shown is used in the second operation, viz., the machining of the beveled surfaces.

There are many other examples that we could illustrate, but enough has been shown to point out the advantage of studying your work intelligently, and securing as efficient a tool as your business will permit. We are all after lower production costs, and a good way to obtain the same is to study your present methods of production, then see if you can make an improvement on the same. Suppose you are putting through certain kinds of work in lots of 5 or 10. Think carefully. Is it not possible to put them through in lots of 10 or 20? If you can conveniently do so, try this method, use the proper equipment, then watch your production costs go down.

## HOW FAR WILL A PUMP DRAW WATER?

This is a question often asked in reference to ordinary pumps used for raising water to just over ground level, and as a rough guide it may be taken that the maximum distance in feet would be equal to the number of inches at which a mercurial barometer is standing, although in practice this depth would usually be impossible, as leakages and friction have to be considered. Usually, says Practical Engineer, a simple pump will, if it is absolutely tight and sound from the piston or bucket to the water level, raise water slowly from a depth of about 30 feet below the bottom valve, but more usually 28 feet would be the limit of effective working, although few pumps can be depended on for more than a 25-foot draw owing to faults in their fitting. Even a pinhole will destroy the vacuum under the lower valve in a very short time or a few grains of sand in the valve, and preventing it closing tightly, will have the same effect, this very often being the cause of pumps "losing water" when drawing from a sandy source. As to how high a pump will lift water above itself, the limits may be defined by the power available to lift the weight and the strength of the appliances used in the putting the necessary power into effective action. Horizontally, water can be moved for practically any distance, taking friction into consideration, as this is considerable. Pumps with more than 25 feet effective suction will rarely be found satisfactory for any length of time.

## RUSTPROOF PROCESS

Rust. Who hasn't heard of the word, far less experienced the trouble of trying to remove it from exposed or neglected material. But now comes a process that is said to overcome the trouble entirely.

The Andrews rustproofing process, with premises at the Andrews Rust Proofing Laboratories, 821 Book Bldg., Detroit, Mich., is said to be exhibiting satisfactory results in this line, and following is description of the process as given out.

The pieces to be rustproofed are placed in a furnace which burns a mixture of gas and air. It is claimed that after the work has reached the uniform heat of the furnace, an atmosphere is created that forms an oxide which penetrates the most minute pores of the metal. The work is then removed from the furnace and immersed in a bath of oil, heated to a temperature of 100 degrees Fahr. The oil carbonizes and, mixing with the oxide, forms a paste which sinks into the pores. At the same time, quenching in the oil contracts the pores and seals up the deposit therein. While the temperature of the furnace is not given, it is stated that it is not high enough to distort or in any way injure the work.

Among the claims made for the process are: That parts treated by it have a fine ebony finish and that they have withstood a test by being sprayed with salt water in a closed vessel for 83 hours and remaining suspended over the salt solution for an additional 157 hours without being rusted.

## INSPECTION OF HOISTING CHAINS

Few details in industrial life cause more accidents to men and machinery than that associated with the handling of heavy material. Too often this work is carried on with little or no attention to the lifting appliances. A chain or rope is secured and placed on the work and it is expected that it will give the same service that it did the previous time. The imperative need of systematic inspection to hoisting appliances was again demonstrated in the fatal accident to a railroad employee in Charlottetown, P.E.I., recently. A locomotive tender was being hoisted from position and the workman was pulling out some blocks from underneath when the hoisting chain broke, the tender falling and crushing his arm. He died following amputation. The safety feature of industrial welfare is one of the factors where consistent co-operation between executive heads and the workmen is essential to mutual confidence and maximum efficiency.

# Points to Consider in Cylindrical Grinding

## Factors Which Determine Wheel-wearing Action—Laws Relating to Draw-in and Traversed Cuts—Production Costs.

By W. H. CHAPMAN*

CYLINDRICAL grinding is a subject in which we are all vitally interested. This paper, which was presented before the American Society of Mechanical Engineers, comprises a study of the laws involved, and an analysis of grinding action both for draw-in cuts and traversed cuts.

In view of the effect of wheel wear on grinding efficiency, formulas are derived for wheel wear in terms of known variables such as grain size of wheel, work speed, wheel speed, feed, etc. By calculating values for wheel wear for different conditions and comparing them with production figures calculated under the same conditions, a proper selection of wheels may be made.

The fact that the expense due to wheel wear comprises but a small item in the total cost of grinding, however, may lead to wrong conclusions if this is made the controlling factor. In the latter part of his paper, therefore, the author discusses the subject of production costs and the various factors that should be considered in securing the highest possible grinding efficiency. With this introduction, let the author speak for himself.

In Fig. 1 is shown a section of wheel and work with the elements greatly enlarged. The grain paths across the work are indicated and a shaded area indicates the shape of a single chip. The grain paths are shown as straight lines tangent to the feed circle. Actually these paths are not straight lines, but are epicycloidal curves. However, within the limits of probable dimensions which are actually involved in any cylindrical grinding operation, a graphical layout of the grain paths on a large scale (say ¼ in. = 0.0010 in.) will show that these curves are so nearly straight lines that the error is negligible. The mathematical relations are greatly simplified by this assumption. By actual trial it was found that there was seldom over 2 per cent. difference in the values of maximum chip depth obtained by the use of the actual and the assumed forms of grain path.

### Wheel-Wearing Action

The three factors to be considered as determining wheel-wearing action are (1) the frequency with which the grain is applied, (2) the average grain depth of cut as indicated by the chip dimensions, and (3) the kinetic energy of the grain due to its mass and velocity.

[In his complete paper, the author here discusses the three factors mentioned and derives the formulas given below for grain depth of cut and for wheel wear, using the following notation:

N = r.p.m. of wheel

V = surface speed of wheel, ft. per min.

u = work speed in ft. per min.

R = wheel radius in inches.

r = work radius, inches

f = depth of cut, inches on work radius

$\mu$ = interval between grains, inches

S = radius of feed circle = r — f, inches

G = maximum depth of chip, inches.]

Frequency of application depends upon the revolutions per minute of the wheel. Work done is measured by the dimensions of the chip removed by each grain and the total number of chips removed. Kinetic energy is proportional to the

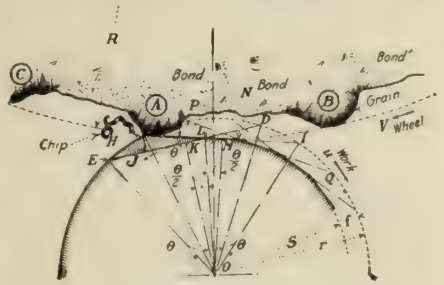

FIG. 1—DIAGRAM ILLUSTRATING THE CUTTING ACTION.

mass and square of the velocity of the cutting particles.

Frequency of application of the grain $= N = \frac{12V}{2\pi R}$, and volume of wheel wear $= \frac{12V}{2\pi R} \times 2\pi R$. Therefore wheel wear is directly proportional to 12V; or dropping the constant, is directly proportional to V.

The formula for grain depth of cut, as derived in the complete paper, simplified by the omission of inconsequential terms, is

$$G = \frac{\mu u}{V} \sqrt{\frac{2f}{r}} \text{ (approximately)} \ldots [1]$$

From this it is deduced that grain depth of cut varies directly with grain interval, work speed, and square root of radial feed; and inversely with wheel speed, and square root of work radius.

The kinetic energy of the cutting particles increases with the square of the velocity. For a certain depth of cut the resistance of the work to the grain is very nearly proportional to this depth, as the cuts are very small, even when compared to the total size of the grain. Theoretically, for some low velocity the kinetic energy of the grain should just equal the energy required to remove the chip (the feed would be reduced to maintain constant grain depth of cut under reduced wheel-velocity conditions) and wheel wear would be caused without any chip being removed up to this point. Actually the bond strength is always sufficient to prevent this condition. Our assumption is then clear that:

Wheel wear varies inversely with the surplus kinetic energy of cutting particles and is inversely proportional to effective wheel surface velocities (wheel speed minus work speed).

We are now prepared to combine factors.

a Wheel wear is proportional to the wheel speed, or to V.

b Wheel wear is proportional to the grain depth of cut, as expressed in Formula [1].

c Wheel wear is inversely proportional to surplus kinetic energy of the cutting particles, or proportional to $1/(V - u)^2$. The term u is usually negligible as compared with V and it may therefore be assumed that $1/V^2 = 1/(V - u)^2$.

From these relations, a, b and c, an index of wheel-wearing action ($WW_1$) due to grinding (where the wheel face is free-cutting) may be expressed as follows:

$$WW_1 = V \frac{\mu u}{V} \sqrt{\frac{2f}{r}} \times \frac{1}{V^2}$$

$$= \frac{\mu u}{V^2} \sqrt{\frac{2f}{r}} \ldots\ldots\ldots\ldots [2]$$

### Laws of Grinding for Draw-In Cuts

From this expression we may derive the following laws of cylindrical grinding, operative within the usual limits of speeds and dimensions. For straight-in (draw-in) cuts a free-cutting wheel will wear according to the effect of wheel-wearing action as follows:

a Wheel-wearing action increases directly as:

1 Grain interval (grain size—inversely as grade)

2 Work speed (surface)

3 Square root of diametral cut (feed).

b Wheel-wearing action increases directly as the following are decreased:

1 Square of wheel speed (surface)

2 Square root of work radius.

A soft wheel is more susceptible to wheel-wearing action than a hard wheel and will more nearly follow the theoretical conditions. It is therefore more free-cutting and will cut more nearly the full chip than a hard wheel. There is consequently a gain in production as wheels of softer grades are used, all other conditions remaining constant, up to the point where the chips are geometrically perfect for a given condition of speeds and dimensions. It is clear from this standpoint that the softest possible

*Norton Co., Worcester, Mass.

wheel should be used. High wheel speeds up to the safe limit are, of course, necessary if the soft wheels are to perform in a satisfactory manner.

To show the practical application of Formula [2] for wheel-wearing action (Index of Wheel Wear), Table 1 is given.

In column 1 of the table are the work speeds provided on a recent grinding machine, given in order so that actual values can be experimentally obtained to check with the theoretical. In the succeeding columns are two series of values as follows:

1 Following the term "Production" are approximate values for cubic inches of metal removed per minute for a wheel 1 in. wide. These were calculated by the formula, Production = nominal work diameter $\times \pi \times$ r.p.m. $\times$ depth of cut (assumed to be 0.0005 in.), which gives values slightly less than the true values.

2 Following the terms "Wheel Wear" are values of the actual wheel wear obtained by multiplying the Index of Wheel Wear, calculated by Formula [2], by a constant derived by experiment. This constant is for convenience expressed in the form $1800 \times 10^{4}$.

Sample Calculation. In Formula [2] assume:

$u = 53$ r.p.m. $= 13.9$ ft. per min.
$r = \frac{1}{2}$ in. (work diameter 1 in.)
$f = 0.0005$ in.
$V = 6000$ ft. per min.
$\mu = 0.05$
$R = 9.0$ in. (wheel radius)
Substituting,

$$WW_1 = \frac{0.05 \times 13.9}{36{,}000{,}000} \sqrt{\frac{0.001}{0.5}}$$

$$= 0.0000000196 \times 0.047 = 9212 \times 10^{-13}$$

Multiplying by constant given above ($1800 \times 10^{4}$),

$WW_1 = 0.0166$ cu. in. per min. for wheel 1 in. wide.

The corresponding "Production" in Table 1 is 0.0835 cu. in.

It will be seen that the wheel-wear values increase rapidly as work speed increases. The value 0.0166 for work of 1 in. diameter at 53 r.p.m. becomes 0.1040 for work of 4 in. diameter at. 167 r.p.m. The same wheel cannot be properly used for both cases, as one sufficiently soft to cut freely in the first case would wear so fast as to be nearly useless in the second case. However, where wheel-wear values are nearly the same we may expect the same wheel to act properly. For instance, a wheel suitable for 1-in. work at 138 r.p.m. wears at the rate of 0.0433 cu. in. per min.; and one suitable for 4-in. work at 72.5 r.p.m. wears at the rate of 0.0450 cu. in per min. In all probability one wheel would serve for both.

### Selection of Wheels for Draw-In Cuts

From Table 1, and by experimental tests with various wheels, certain ranges of wheel-wear values may be found which correspond to definite grades of wheels of suitable grain size and abrasive for the material to be ground. Once this is done, the selection of proper wheels is no longer a question of guesswork, as wheel-wear indices may be computed for any set of conditions and the proper wheel selected. The question of the variation in wheels has been reduced to a point where it no longer can be a very large factor, and we may always change our speeds or feeds to correct the action in the proper direction if we understand the laws which have been previously pointed out. As an example of the possibilities of wheel selection, it has been found that for a certain machine the following wheels (Norton system of grade) are suitable for straight-in cuts on mild steel:

| Wheel Designation | | Wheel-Wear Values, Table 1 |
|---|---|---|
| 36 or 46 J | for values from | 0150 to .0250 |
| 36 or 46 K | for values from | .0250 to .0350 |
| 36 or 46 L | for values from | .0350 to .0450 |
| 36 or 46 M | for values of | .0450 and higher |

Use no wheels harder than M. For hard materials use a grade softer and No. 60 grain. These values are for straight-in cuts only.

Influence of Feed. As an example of the effect of doubling the feed, let us assume the conditions as above, except that the feed is increased to 0.001 in. (on radius).

$$WW = \frac{\mu u}{V^2} \sqrt{\frac{2f}{r}} = \frac{0.05 \times 13.9}{36{,}000{,}000} \sqrt{\frac{0.002}{0.5}}$$

$= 1200 \times 10^{-13}$.

Wheel wear $= 1800 \times 10^{4} \times 1240 \times 10^{-13} = 0.0224$ cu. in. per min. per inch of wheel face. Production is approximately doubled and

$$\text{Wheel-wear increase} = \frac{0.0224 - 0.0166}{0.0166} \times 100 = 35 \text{ per cent.}$$

This indicates how advantageously an increase of feed operates to obtain increased production (up to the limit of grain penetration). If we had doubled work speed we would simply have doubled both production and wheel wear.

### Traversed Cuts

The most important development in recent grinding machines is the recognition and utilization of the fact that overall operating efficiency for traversed cylindrical work increases as traverse speeds are increased. (This assumes that for a given traverse speed, width of wheel and revolution of work are so related as to cause the cutting face to just cover the lead of the work.)

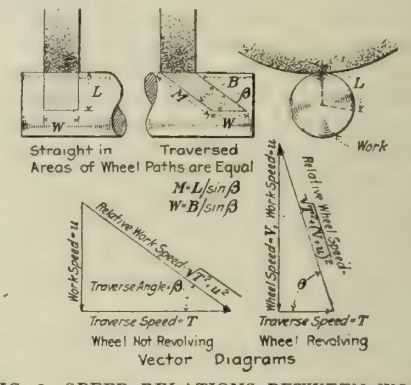

FIG. 2—SPEED RELATIONS BETWEEN WORK AND WHEEL.

Referring to Fig. 2, let

W = width of wheel face

L = length of projected arc of rotation of work

M = actual length of path of traversed cut

B = actual width of path of traversed cut

$B$ = traverse angle

Then $B = W \sin B$; $M = L/\sin B$; areas $W \times L$ and $B \times M$ are equal. Wheel width of cut is proportional to W for straight-in cut, but reduced to B for traversed cut.

It is to be noted that relative work speed has been increased over actual work speed in the inverse proportion of the sine of the traverse angle. This relative increase does not appear in the projected (end view) relations. As these alone affect individual grain depth of cut, we have gained in relative work speed to get over the longer path M so as to cover the same area in the same time on a narrower width, B, without increasing grain depth of cut.

Now if the wheel rotates, each grain cuts across the work at an angle $\Theta$, resulting from speed relations shown by Fig. 2 (vector diagram for rotating wheel). Then the individual grain paths are at a much steeper angle than the wheel path to the axis of work rotation, but we have gained in relative wheel speed without increasing individual grain depth of cut. Our wheel width of cut is also reduced by a slight amount proportional to $\sin \Theta$, which is of course much less than the reduction before the wheel was rotated. The net result is a reduction in wheel stress proportional to $\sin \Theta$ and an increase in work speed proportional to $\sin B$, without increase in grain depth of cut.

TABLE I. COMPARISON BETWEEN WHEEL WEAR AND QUANTITY OF METAL REMOVED AT DIFFERENT SPEEDS

| Work Speed in r.p.m. | | Work Diameters — 1 in. | 2 in. | 3 in. | 4 in. |
|---|---|---|---|---|---|
| 53 | Production | 0.0835 | 0.1670 | 0.2500 | 0.3340 |
| | Wheel Wear | 0.1140 | 0.0236 | 0.0290 | 0.0334 |
| 72.5 | Production | 0.1140 | 0.2280 | 0.3420 | 0.4560 |
| | Wheel Wear | 0.0226 | 0.0319 | 0.0390 | 0.0450 |
| 87 | Production | 0.1370 | 0.2740 | 0.4110 | 0.5480 |
| | Wheel Wear | 0.0273 | 0.0387 | 0.0475 | 0.0546 |
| 101 | Production | 0.1586 | 0.3172 | 0.4758 | 0.6344 |
| | Wheel Wear | 0.0316 | 0.0448 | 0.0540 | 0.0635 |
| 138 | Production | 0.2160 | 0.4320 | 0.6480 | 0.8640 |
| | Wheel Wear | 0.0433 | 0.0612 | 0.0645 | 0.0865 |
| 167 | Production | 0.2620 | 0.5240 | 0.7860 | 1.0480 |
| | Wheel Wear | 0.0522 | 0.0740 | 0.0910 | 0.1040 |

Wheel diameter 18 in.; surface speed, 6000 ft. per min.; diametral feed per work revolution (automatic feed), 0.001 in.; grain of wheel, 66 16 Alundum; material, mild machinery steel.

The "head resistance" against the wheel as a whole is reduced by the sin $B$ factor, while wheel width of cut is reduced by sin $\Theta$. These both directly affect wheel wear. For traversed-feed conditions our grain depth of cut remains the same as in straight-in feeds, but wheel wear is reduced in the proportion of sin $B \times$ sin $\Theta$.

If T = traverse speed, V = wheel speed, u = work speed, then

$$WW_1 = \left(\frac{u}{\sqrt{T^2 + u^2}}\right)\left(\frac{V + u}{\sqrt{T^2 + (V + u)^2}}\right)$$

$$\left(\frac{\mu u}{rV^2}\right)\left(\sqrt{2rf}\right) \ldots\ldots\ldots\ldots\ldots [3]$$

In practical cases the second term will be so nearly 1 that it may be neglected. It is evident that T affects the quantity appreciably only when u is kept relatively low. This indicates that a wide wheel should be used to get the effect of reduced wear for a given production, traversing as rapidly as possible. The above formula assumes no overlapping of the cut.

Now by making assumptions and neglecting values whose effect is so small as to make no appreciable difference for purposes of comparison, we reduce the expressions for $WW_1$ exactly as we did in the case of straight-in feeds and obtain:

Index of wheel wear

$$WW_1 = \frac{\mu u}{V^2}\left(\frac{u}{\sqrt{T^2 + u^2}}\right)\sqrt{\frac{2f}{r}} \ldots\ldots [4]$$

**Laws of Grinding for Traversed Cuts**

From this it is evident that for traversed work:

a Wheel wear increases directly with the work speed

b Wheel wear decreases directly as the decrease in the quantity which we term "traverse factor," which is work speed divided by the square root of the sum of the squares of traverse and work speeds

c Wheel wear decreases directly as square of wheel speed increases

d Wheel wear decreases directly as the square root of the work radius increases

e Wheel wear increases directly as the square root of the feed increases.

The value $\frac{u}{\sqrt{T^2 + u^2}}$ in our expression for index of wheel wear is our traverse factor. Where T is large with respect to u this factor will be appreciably less than unity, but as u increases the reduction in wheel-wearing action is less pronounced.

Table 2 gives values of the traverse factor for a certain machine having the work speeds previously given for draw-in cuts, and the following table (traverse) speeds: 10.02, 14.00, 17.00, 19.70, 26.90 and 32.60 ft. per min. The table shows combinations of speeds giving leads from 2.3 in. upward. As the machine was designed for a wheel 2½ in. wide, combinations of speeds giving lesser leads of work are not given.

TABLE 2. TRAVERSE FACTORS

| Traverse ft. per m. | Wk. r.p.m | Lead in. | Work Diameters 1 in. | 2 in. | 3 in. | 4 in. |
|---|---|---|---|---|---|---|
| 10.02 | 53 | 2.3 | 0.810 | 0.950 | 0.975 | 0.985 |
| 14.00 | 53 | 3.1 | 0.705 | 0.883 | 0.946 | 0.968 |
| 14.00 | 72.5 | 2.3 | 0.805 | 0.938 | 0.968 | 0.976 |
| 17.00 | 53 | 3.8 | 0.632 | 0.850 | 0.926 | 0.955 |
| 17.00 | 72.5 | 2.8 | 0.730 | 0.910 | 0.955 | 0.974 |
| 17.00 | 87 | 2.3 | 0.802 | 0.935 | 0.972 | 0.985 |
| 19.70 | 53 | 4.4 | 0.576 | 0.817 | 0.905 | 0.943 |
| 19.70 | 72.5 | 3.2 | 0.691 | 0.884 | 0.943 | 0.967 |
| 19.70 | 87 | 2.7 | 0.756 | 0.916 | 0.961 | 0.980 |

| 26.90 | 72.5 | 4.4 | 0.574 | 0.815 | 0.902 | 0.942 |
| 26.90 | 87 | 3.6 | 0.646 | 0.860 | 0.931 | 0.958 |
| 26.90 | 101 | 3.1 | 0.703 | 0.890 | 0.950 | 0.974 |
| 26.90 | 138 | 2.3 | 0.801 | 0.936 | 0.960 | 0.982 |
| 32.60 | 53 | 7.35 | 0.397 | 0.655 | 0.790 | 0.865 |
| 32.60 | 72.5 | 5.3 | 0.505 | 0.760 | 0.867 | 0.919 |
| 32.60 | 87 | 4.4 | 0.580 | 0.815 | 0.908 | 0.945 |
| 32.60 | 101 | 3.8 | 0.635 | 0.854 | 0.927 | 0.960 |
| 32.60 | 138 | 2.8 | 0.748 | 0.914 | 0.945 | 0.977 |
| 32.60 | 167 | 2.3 | 0.807 | 0.936 | 0.967 | 0.982 |

If we now multiply each of the traverse factors in Table 2 by the wheel-wear value for the corresponding work speed and work diameter as shown in Table 1 (draw-in cuts), we will have a table of wheel-wear values for traversed cuts. These products are given in Table 3.

By assigning certain wheels to specified ranges of wheel-wearing action, we may select the proper wheel through the use of Table 3 in the same way that we did from Table 1. Actually in the case of Table 3 the wheels used would be somewhat softer for the same index figure because the actual depth of cut does not follow the indicated depth (as shown by the feeding mechanism) as closely for traversed work as for draw-in work, and therefore the actual cut is not so deep. This means, of course, that the "spring away" action of the work is more pronounced for traversed than for draw-in work. Careful use of steady rests is therefore very essential.

The following wheels are found to be satisfactory for our machine for traversed cuts on mild steel under the assumed conditions:

| Wheel Designation | | Wheel-Wear Values, Table 3 |
|---|---|---|
| 36 or 36 I | for values up to | .02500 |
| 36 or 46 J | for values from | .02500 to .04000 |
| 36 or 46 K | for values from | .04000 to .05000 |
| 36 or 46 L | for values from | .05000 or .06000 |
| 36 or 46 M | for values from | .06000 |

Use No. 60 grain for hard material and a grade softer; but use no wheel softer than I.

Important Note. These statements of wheel assignment are based upon assumptions of the best machine conditions and most careful operation to prevent any abuse of the wheel. Field practice will usually show harder wheels in use due to conditions which abuse the wheel. Efficiency is sacrificed where such is the case.

**Production Costs**

If wheel wear were the most important element of production cost, grinding efficiency might be considered on this basis without leading to the fallacy which exists to-day. As a matter of fact, the wheel cost is almost negligible compared with the other costs, and wheel selection should be based upon the production capacity of the wheel under the given set of grinding conditions, allowing the wheel wear to be as high as is necessary to get a free action without excessive wear (which would cause difficulty in sizing work and the need for frequent dressing). The all-important factor is the rate at which the wheel may be made to cut and still not get out of truth. This affects the grinding time, any reduction of which is of vastly more importance than an increase of wheel wear which may result from such a reduction.

TABLE 4. PRODUCTION-COST FACTORS.

| Table Speed, ft. per min. | Work, r.p.m. | Lead, in. | Diam. of Work 1 in. | 4 in. |

clusive of wheel cost) is, say, five cents per minute, including labor at day-rate wages. The useful content of the wheel may be assumed to be such that the wheel is actually worth seven cents per cubic inch. If production could be increased to 2 cu. in. per min. where previously we obtained 1½ cu. in. and wheel wear jumped from 0.15 cu. in., say, to 0.25 cu. in. per min., our first cost would be: $(0.05 + 0.15 \times 0.07) \div 1.5 =$ \$0.0404 or 4.04 cents per cu. in. removed. In the second case, $(0.05 + 0.25 \times 0.07) \div 2 =$ \$0.0338, or 3.38 cents per cu. in. removed.

Now the overall production efficiency of the machine based upon all costs involved is indicated by production-cost factors proportional to the earning rate of the machine. In the first case this factor would be: (production) ÷ (cost) = $\frac{1.5}{0.05 + 0.15 \times 0.07} = 24.8$. In the second case, $\frac{2.0}{0.05 + 0.25 \times 0.07} = 29.6$

It evidently will pay to wear the wheel more in order to obtain the higher rate as the overall gain in the foregoing is about 19 per cent. The above assumed values are reasonable and the figures given might be considered as typical. Table 4 gives these production-cost factors, or relative earning rates based upon these costs and the grinding conditions previously assumed in Tables 1, 2 and 3, the variations being due to traverse and work-speed relations only, but with proper choice of wheels in each case. Then, for the machine which we have used as an illustration it is evident that for work of a certain size and a wheel of a certain width there is one speed combination which will utilize the machine to the greatest profit. If we are able to use wheels of the width needed to cover the lead under the best speed-relation conditions, we will obtain the best earning rate of which the machine is capable. If wide wheels are not available, we still have speed-relation conditions which will give very nearly as high a rate for the narrower wheels.

In Table 4 the production-cost factors are given for 1-in. and 4-in. diameters of work only. The factors may also be expressed as earnings per unit of time, or the relative amounts the machine would earn in equal lengths of time under the various conditions as given.

Note that, due to high traverse, a 2.3-in. wheel which earns \$3.68 in a certain length of time when grinding 1-in. work at low traverse and work speeds, will earn \$10.62 in the same length of time when using the high speeds. If the widest wheel (7.35-in. face) be used the machine will earn \$11.70 in the same length of time. The grade of wheel is suitable in each case according to the speed changes. This clearly shows that high traverse speeds cause a corresponding increase in earnings in spite of the necessary increase in work speed.

Considering the cost of wheels 7.35 in. wide as compared to wheels 2.3 in. wide, and the relative power required to drive the two wheels, it is very evident that the use of a harder wheel 2.3 in. wide would offset the difference in wearing action without greatly reducing production and that the production of the 7.35-in. wheel is matched by the production of the 2.3-in. wheel using highest traverse and highest work speed.

The most striking conclusion from the above is the fact that in order to use a narrow wheel and get great production the high work speed does not cause excessive wheel wear due to the relief on the wheel brought about by the high traverse speed. This traverse speed is also necessary to allow the rapid exposure of fresh work surface to the cutting face, making for a highly economical combination.

The foregoing should demonstrate clearly what this new development in the science of grinding may mean to the art as practised throughout our production shops.

Actual grinding tests upon a machine having the high-traverse feature, and making use of the speeds shown in the table, have conclusively proven the deductions indicated by the mathematical calculations. On mild machine steel (0.15 per cent. carbon) over diameters ranging from ¾ in. to 4 in., production rates as high as 2.00 cu. in. per min. have been easily attained, grinding to limits of 0.0010 in., removing 0.060 in. from the diameter over lengths of from 36 to 72 in.

When machine conditions, truth and balance of wheel, and proper use of steady rests and grinding compound are intelligently and skilfully handled, wheels of 36 and 46 grain size, and grades I to L (Norton system of grading) have been used in these roughing operations. Especially where the feeding is carefully regulated so as never to crowd the radial depth of cut to more than the possible depth of grain penetration (say, not to exceed 0.0015 in. on the diameter) per traverse, it has been found that the wheel face remained sufficiently true to leave a commercial finish of fair degree absolutely free from chatter marks, feed lines or any other imperfections of real or imaginary consequence.

Owing to the fact that in the above the highest work and traverse speeds were used in every case, the grade (hardness) of wheel was increased as the diameter of the work increased. This is in accordance with our formula for index of wheel wear. Instead of considering the work speed and work radius independently, they were in this case tied together by the fact that a constant work r.p.m. was used. The expression for this is as follows:

$$\text{Work speed } u = \frac{2\mu rN}{12} \quad \ldots\ldots\ldots [5]$$

where r = work radius (inches) and N = r.p.m. Substituting [5] in [4],

$$WW_1 = \frac{0.275\mu}{V^2}\left(\frac{N^2}{\sqrt{(T^2 + 0.275r^2N^2)}}\right) \times \sqrt{2fr^3} \quad \ldots\ldots\ldots [6]$$

Now, if V, N, T and f are made constant, $WW_1$ must vary as the value r appears in the formula, the greatest effect being the $\sqrt{r^3}$ factor and we would expect therefore to use harder wheels as r increases.

### Conclusions

The conclusions to be drawn from the foregoing are definite and indicate positively how to arrive at the solution of precision grinding problems, provided one has an intelligent knowledge of abrasive wheels and the usual materials ground.

Greatest grinding efficiency is obtained by the use of the softest wheels suited to the nature of the material ground. This efficiency is dependent upon the control of the dimension and speed relations between the wheel and the work so that the individual chip may have the minimum depth for a given volume determined by the maximum allowable radial depth of cut. This means long arc of contact, low work speeds and maximum feeds. With these conditions established, increase of traverse speed increases production without increase of wheel-wearing action. Machine conditions must be such as to maintain as accurately as is reasonably possible the speed and dimensional relations of the wheel and the work.

There is an enormous field for the industrial engineer in obtaining better production at less cost in grinding operations. There is a definite science involved, there is no mystery about it. The proper appreciation of the laws of grinding by machine designers and operators is rapidly increasing and we may expect a constant improvement in the art as a consequence.

---

**Too Good To Be True.**—A newspaper despatch from Ottawa a few days ago stated: A question answered in the House has whetted curiosity a bit. That answer states that the contract for steel plates with the Dominion Steel Co. has been cancelled and that the Government is not required to pay any damages on account of the cancellation. Explanation of all this is awaited, as the plate contract was large and generally considered fat. That the Government got out of it without the payment of a dollar seems almost too good to be true.

*The figure of 5 cents a minute as time cost of operation is based upon labor at 75 cents an hour and an hourly burden of \$2.25 an hour (power, investment, rent, heat, light, etc.)

# Have You Tried This Contest Yet? If not--- Do so Now

Below will be found twelve references to advertisements in this number. To the sender of the first correct set of answers to these we will forward one of these scales.
To win one is not difficult, and at the same time you will add to your store of knowledge. Read the details given below.

The scale is 6 in. long and is made from finest quality steel. One side is marked in 32nds, the other side in 64ths. A table of decimal equivalents is also stamped on one side, and a table of tap drill sizes on the reverse side. This scale is well worth securing.

## What You Have to Do

We publish every week a number of interesting facts or statements selected from the advertising pages for that week. The selections for this issue are given below. Read these through, then turn to the advertising section and see if you can pick out the advertisements to which they refer. The work is interesting, it will train your powers of perception and of memory, it costs you nothing, it will make you better acquainted with the various lines of machinery and tools in the market, and with perseverance you are bound to win one of these useful scales as a prize.

We welcome a new name to the list of scale winners. D. G. Gains, engineer, at Montreal, P.Q., was the only reader to send in a correct list. Question No. 4 was the stumbling block. Note how large the request sticks out in this advertisement, then you will see why we listed it as we did.

### CONTEST FOR MARCH 31ST ISSUE

**Contestants are required to write us, stating to which advertisements we refer in this number.**

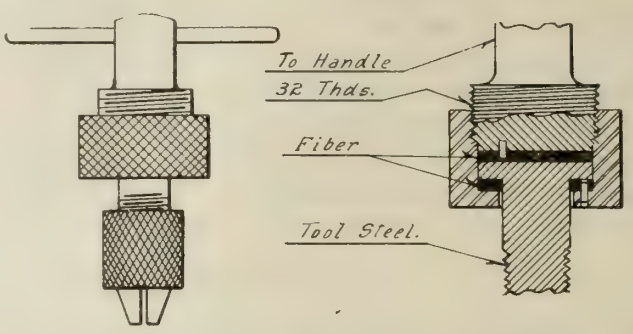
1 A request for your name and address so that you can get something for nothing.
2 A very pertinent question.
3 A machine designed to give rapid and accurate production.
4 A very common requirement.
5 Something said to be filling a long-felt want.
6 How to save time and money when drilling, tapping, etc.
7 Something that makes no allowance for error.
8 A product that will stand gruelling punishment.
9 A machine that has three important features.
10 Something of value that is given free.
11—A seemingly foolish question.
12—Something that offers indisputable evidence.

### These are Correct Answers for List from March 10th Issue:

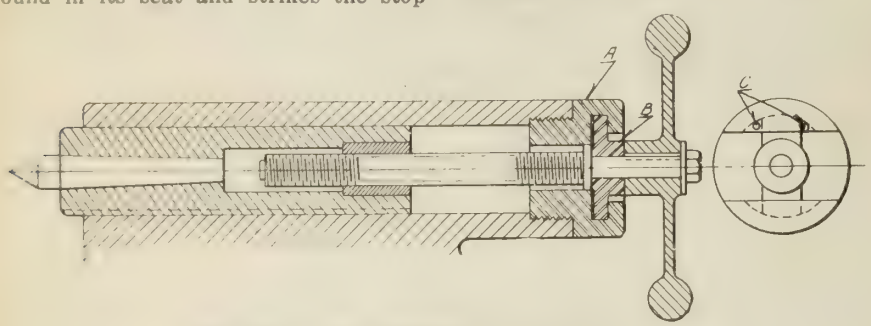
1—Kearney & Trecker.
2—The Tube Co. of Canada.
3—J. C. McLaren Belting Co., Ltd.
4—Hamilton Gear & Machine Co.
5—L. S. Starrett Co.
6—Canadian Blower & Forge Co.
7—A. R. Williams Co.
8—Keller Pneumatic Tool Co.
9—Murchey Machine & Tool Co.
10—Cleveland Pneumatic Tool Co. of Canada. Ltd.
11—John Bertram & Sons Co., Ltd.
12—Dominion Steel Products Co., Ltd.

## Closing Date for This Contest is April 21st.

# WHAT OUR READERS THINK AND DO



## QUICK ACTING TAILSTOCK



By John Homewood

Desiring a quick acting tailstock for our spinning lathes, here is what we did. We replaced the regular rear thrust cap with a steel one of the type shown at A on accompanying sketch. This cap was bored out to allow the screw to slide through. A tee slot was placed in this cap to form a seat for the latch B as shown, this latch being free running on the screw.

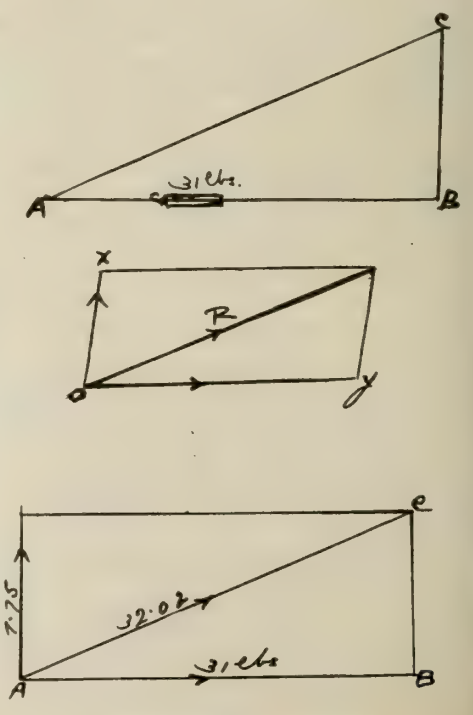
When we desired to release our tailstock, we gave it a quarter of a turn, and pulled it back out of the way. To bring into service, we merely pushed it up, gave it a twist and tightened it into place. In action the lock is turned around in its seat and strikes the stop pin C. We found that this idea saved considerable time and gave satisfactory service.

SECTIONAL AND DETAIL VIEW OF THE TAP WRENCH.

SECTIONAL VIEW THROUGH THE TAILSTOCK.

## HOW TO PREVENT SOME TAP BREAKAGE.

The drawing shows a friction tap wrench—a tool that it will pay any shop to have for smaller work. It is the familiar T wrench, but with a change in the stem, which is divided midway between chuck and handle for the friction device.



The sectional view shows how the friction works. It has the same construction as the safety tapping devices on the market. A divided shaft, one member of which is flanged to make the "friction" surfaces against which fiber collars bear, is united by a threaded coupling that may be set to any tension desired in accordance with the apparent strength of the tap or the material being worked.

The assembled wrench is neat in appearance and is a first class safety in any hands but the most indifferent. As with all friction tappers, it should be loosened up when starting on a new job —it will then slip, but can be set up tighter until the slipping is reduced to a reasonable amount.

## COMPOSITION OF FORCES

**Question:**—A B C is a triangle, of which the angle B is a right angle and the sides A C and B C are 60 inch and 15 inch respectively in length. The spring balance D is subjected to a stress of 31 lbs. What are the components of the stress on D along A C and B C ?

**Answer:**—What our correspondent is after is, we think, an explanation of the resolution of forces. His question is stated in a rather peculiar manner, as there is no need to suppose the presence of a spring balance. A force of 31 lbs. acts along the line A B. Now this force would be one of the components of the resultant force, which is expressed in magnitude and direction by the diagonal of the parallelogram of forces. Any two forces acting through a common point, can be resolved into a single force acting through the same point in the following manner. Let the lines OY and OX represent in magnitude and direction two forces acting through the point O. If we complete the parallelogram as shown, the diagonal will represent in direction and magnitude the resultant of the two forces. Similarly if we have a single force we can resolve it into two forces at right angles to each other. In the case given we can assume the two forces to be acting along BC and AB through a common point A. The force acting on the BC will be equal to AB sine A, which is taking the measurements given, .31 x 15/60, while the force acting on AC is equal to AB/cos. A, which is 31/.968. These give us respectively 7.75 and 32.07 lbs. The component forces are 7.75 and 31, while the resultant force is 32.02.

RESOLUTION OF FORCES.

## FIVE SHORT CUTS

By J. H. MOORE

IN describing this short trip through a certain plant, it is only fair to state that the ideas about to be told were picked at random, and noticed while on the walk, so to speak. In a way, there is a lesson to be learned from this, viz., that it is wonderful what you can notice while on a tour through any plant. It pays to keep your eyes open and your mind clear, for you never can tell when some real idea may appear.

The first thing I noted was the spinning of some rivets. The work being accomplished was the riveting of small spring steel clips to spring steel grain tubes. "Didn't you use to do that by the hammer method?" I enquired. "Yes," was the reply, "but we broke so many tubes that we decided to adopt the spinning method. Since the new machines have been installed we have had no further trouble. Production is satisfactory, and we get just as good results."

The next thing that aroused my curiosity was a double punch die. The punch die section itself was only about 4⅛ in. wide, yet two separate rows of punches were plainly visible. "What's that used for?" I asked.

"That's the die for punching the platform," came the reply, my informant knowing that I was familiar with the shape of the piece in question. For the benefit of readers let me explain that this particular piece called the platform is made of sheet metal and is about 36 inches square. On all four sides is a row of holes, these of course varying in size, and even in center distance. Having worked at this plant in days gone by, I knew that the big idea in those days was to make an elaborate die that would punch all holes at one stroke. "Did you never make the big die?" I asked, and laughingly came the reply, "I should say not. After we drew up the plans and estimated the cost, we found it would run us about $3,500 or more. This was a rather imposing figure and we shelved the matter indefinitely. Suddenly the idea you see before you was suggested. As you can notice, the dies are placed in an ordinary standard die section, which in turn fits our standard bolster. Each die is an insert, therefore is easily replaced when worn, and at very little cost. The same condition holds good for the punches. In punching one side, we use the first line of punches, while for the others we use the second line. A simple gauge guarantees the position of the stock, and although we have to handle the work twice, the production is splendid, at the same time the upkeep of the die is practically nil. Instead of $3,500 (the cost of the elaborate die), the one as used cost less than $500, so you see it was a good move all around. It's just another story that goes to prove that elaborate ideas are not always the best. In case you imagine me prejudiced let me show you one example of misplaced effort."

### WE WANT IDEAS

It is our earnest wish to make this section a real help to every reader. It is only by an interchange of ideas that such a condition can be made possible. Why is it that we do not receive more short cuts and machine shop kinks for this department? Is it because there are no new ideas, or time-saving kinks in existence?

Of course not, for in every shop throughout Canada there are little stunts and devices in use that we want to tell about. We cannot see them all, so it's up to the readers to tell us about them.

Do not bother about your style of writing. Send us an idea that's worth while, and we will soon whip it up into shape. Send us a sketch or a blueprint of the device, together with your own style of description, and we will do the rest.

Not only that, but we'll pay you a good price for every article published.—Editor.

Soon we were standing at a long die that looked very much like a dam for a lock. There was a wheel attached, this in turn moving a vise up and down a slide. "This is what I call exhibit A," remarked my guide. "The work which it was supposed to accomplish was the bending of a piece of sheet metal to a certain angle. Without my knowledge this was wished on me, but I never even used it, as the time it would take to bend a piece on the fixture is over twice what it takes to do it by hand. What we actually do is this. A girl takes the piece of metal, holds it a certain distance over the bench, and hits it a blow with a wooden hammer. The complete operation is accomplished in less time than it would take to place the piece in the fixture, so you see this is yet another story to prove that before a change is made it is well to study all the angles of the case."

### Milling Fixture

The next scheme noticed was a fixture used in milling keyways on some shafts. The fixture was made in double style, that is, two duplicate fixtures on the one main casting. This of course allowed the unloading and reloading of one fixture while the work was being performed on the other. Six pieces were held in each jig, and strange to say all six pieces were gripped by one main handle. On investigation I found a series of eccentrics underneath the fixture, these operating the float clamps on top.

A point that I couldn't help but comment on was how easy the pieces came out of the vee blocks, and on inquiry here is what I found. The lower vee block was the regular 90 degree style—but, the top clamps were bevelled 40 degrees, not 45, so that the slight change in this angle made all the difference in removing the pieces from the jig.

The last scheme that I noted was not so much a new fixture as a new machine. "Didn't you used to plane your drop die blocks?" I asked. "We sure did, but found it cheaper to purchase that special manufacturing miller you are looking at. Where before we took from three to five hours for each block, we can now complete a set every 2½ hours by the straddle mill process. We find it easier to keep the different faces square with each other, and we do not tie up our planers as we did before."

These ideas are not by any means world beaters, but just ordinary everyday problems met with in the average shop, and go to show what can be accomplished by sticking to the problem in hand.

## BURNING FUEL OIL

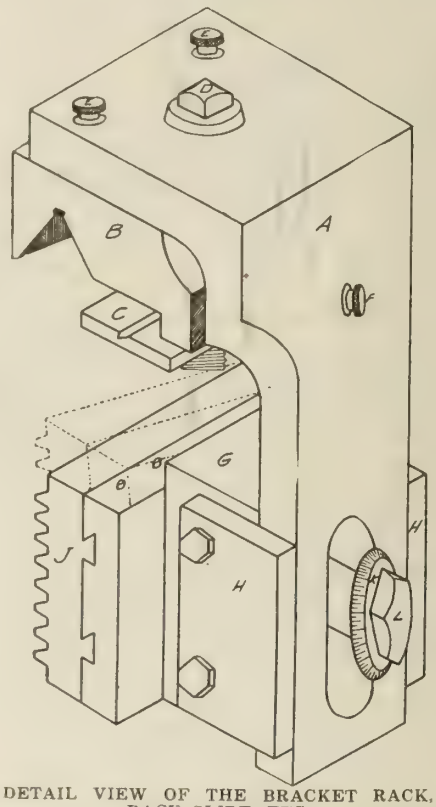
Set the burners open wide,
Do not touch the valves at side;
Keep the pressure on the pump,
And up the bally steam will jump;
If the smoke is black and thick,
Open up the fans a bit;
If the smoke is thick and white,
To slow the fans will be quite right;
For when sufficient air is given,
No smoke ascendeth up to heaven.
If the jets refuse to squirt,
Assume the cause is due to dirt.
Should the flame be short and white,
You have combustion clear and bright;
But should the flame be yellow and long,
Combustion is entirely wrong.
A wise man to his heater sees,
And keeps it 200 degrees;
To have it more is not quite wise,
Because the oil may carbonize;
A little lower has been found
To give as good results all round.
If the filters are kept clean,
No rise in pressure will be seen;
But should the pump kick up a ruction,
There's likely air within the suction.
The pressure governs the supply,
So do not keep it very high.
If these instructions you will follow,
You'll beat the other fellow hollow.

Extract from "Marine Engineering Knowledge," W. C. MacGibbon.

## RESISTANCE OF BODY

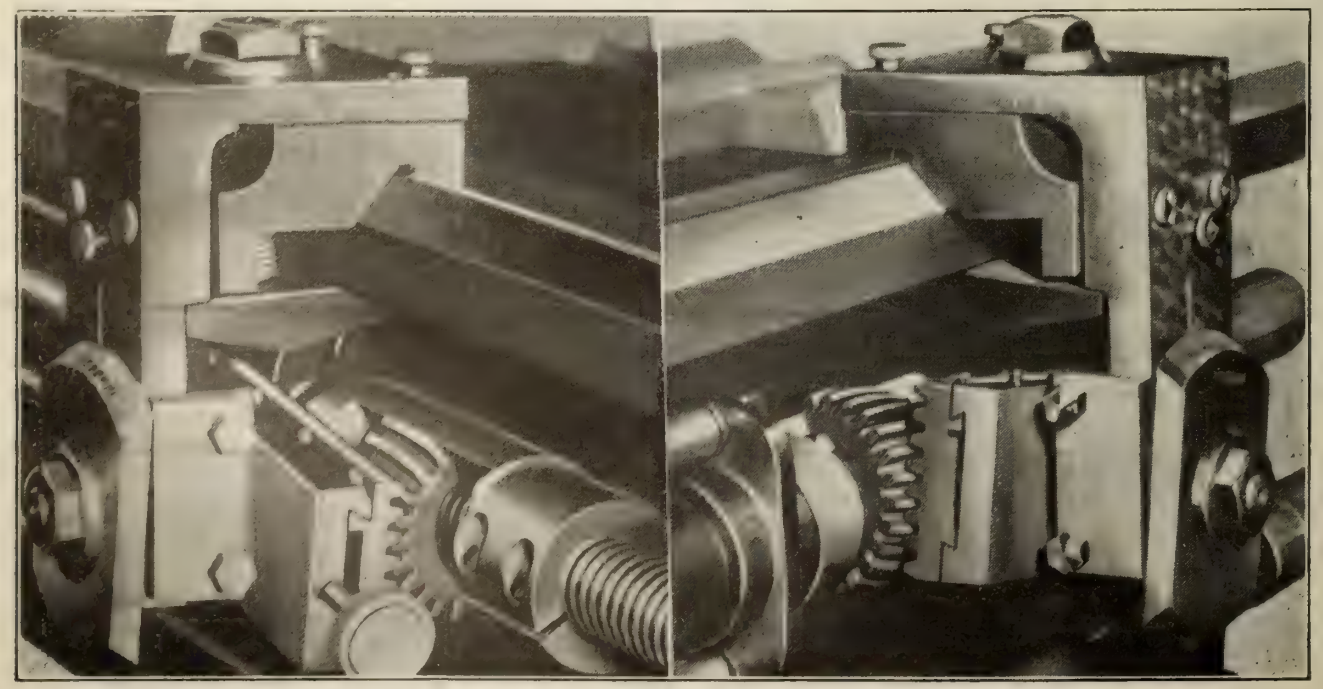
Measurements have been made during the past few months by the American Bureau of Standards of the electric resistance of the human body, the measurements being made in such a way as not to include the resistance through the skin where currents entered and left the body. By eliminating the large and uncertain resistances through the skin, results were secured which are said to be more consistent than any previously obtained. These show that the resistance of the same part of the body of different individuals may differ by a ratio of three to two or even more, the resistance of a person changing from day to day and often by small amounts in an hour. The resistance also depends to some extent upon the position of the body and the extent to which the muscles are relaxed.

# DEVELOPMENTS IN SHOP EQUIPMENT



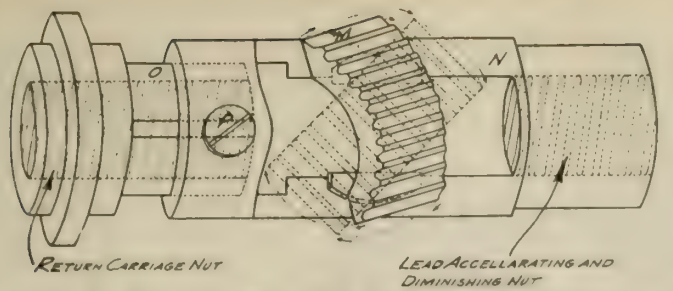
## THREAD LEAD-SCREW VARIATOR

The Precision and Thread Grinder Manufacturing Co., 1 South 21st St., Philadelphia, Pa., is manufacturing a lead-screw variator for lathe attachment. The variator is built in two models of similar design but different size. The Model "A" is adjustable to fit lathes up to 12-in. swing. The Model "B" to fit lathes from 13-in. to 20-in. swing. The normal length of travel for the carriage is 6 inches, but greater lengths can be provided



This device is intended for elongating or diminishing the normal lead on lathes, also for correcting errors in the lead of the screw. It is used to aid the ordinary lathe to perform precision thread cutting, and metric threads can be cut without the use of translating gears. Briefly, here are the main points of the device.

The stationary part of the device consists of a bracket, clamped on the ways of the lathe. This bracket is composed of two pieces, the outer frame and the ways adaptor. These can be seen on sketch. The outer frame is adjustable horizontally sufficiently to make the proper connection between the bracket and the mechanism carried on the lead screw. The bracket carries a swiveling rack and provision is made for vertical adjustment to bring the center of the rack pivot in line with the center of the lead screw. The adjustment can be locked, and subsequent tilting of the rack does not disturb it. A dial is provided, to show the degree of inclination of the rack.



DETAIL VIEW OF THE BRACKET RACK, RACK SLIDE, ETC.

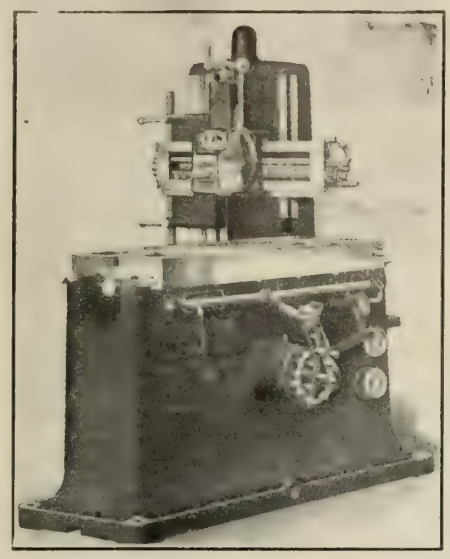
The mechanism on the lead screw consists of an adjustable nut, having an extension carrying a gear segment that is free to swivel in line with the rack. The variation in the lead is obtained by the rotation of this half gear, in accordance with the angle at which the rack is set, as the nut is traversed by the action of the lead screw. The lead-screw nut in the lathe carriage is not employed, but the connection is made between the variator nut and the carriage by the two rods and plate. The variator nut moves the lathe carriage only during the machining operation. The return of the carriage to its initial position is obtained by a second nut, keyed in the frame of the variator nut to permit longitudinal movements independent of those making variations in the lead. The two views shown illus-

THESE TWO VIEWS SHOW THE DEVICE AT THE START AND FINISH OF THE TRAVEL.

DETAIL VIEW OF THE VARIATING NUT, ALSO RETURN CARRIAGE NUT.

trate the device at the beginning and end of the traverse.

A dust guard is furnished to protect the lead screw from abrasive dust when performing grinding operations. It is recommended that the variator be positioned near the tailstock end of the lathe, as that part of the lead screw is generally but little used.



In order to aid in setting the lead variator for either the normal lead of the screw or for a change of lead, a gage block is provided. The block is used by clamping it directly upon the threaded work, it fitting all diameters up to 3 inches. The block is 1 inch thick, so that by turning the work through the same number of turns as threads per inch required and measuring the travel of the carriage by a dial indicator on it adjusted to fit the block, the variation of the pitch of the lead screw can be determined. The desired pitch can be obtained by varying the angle of the swiveling rack to suit the conditions, and then locking it in place.

The device is said to be particularly useful in the manufacture of taps and thread gages, as the necessary correction in the lead can be made while machining, in order to compensate for changes of size during heat treatment, thus reducing the amount of grinding required after hardening. Of course, a sample is first made up from the stock to be used, so as to ascertain the correction necessary.

## SHAPING PLANER

The Automatic Machine Co., Bridgeport, Conn., have placed on the market the Coulter shaping planer as shown in photograph. A feature of this machine is the combination clutch and brake mechanism operated from the front, by means of which the table can be stopped and started instantly without bothering the motor or countershaft. In fact, with this arrangement, no countershaft is necessary on the belt-driven model, as it can be belted direct to the main line shaft, saving ceiling space where head room is limited. A length of stroke indicator is provided, also clamps for clamping the down feed while the cross feed is working, or vice versa.

The clutch-brake mechanism consists of a raybestos-lined brake and a main driving pulley made up of two concentric wheels, the inside rim of one and the outside rim of the other being beveled at an angle which by repeated tests has been shown to be most satisfactory for the purpose. When by movement of the operating handle the clutch is thrown out, the brake is simultaneously applied and released again when the clutch is thrown in. There is a split nut on the driving shaft so that the amount of friction in the clutch can be adjusted. The large bearing surface and large diameter means the minimum of wear, the maximum of torque for the minimum of friction, absence of any appreciable heating, and the arrangement is so simple that there is nothing to get out of order. From this friction pulley the power is transmitted through sliding gears of large diameter to a bull wheel and crank which drives the table similar to the mechanism driving and shaper ram. The transmission shafts of this driving mechanism run on ball bearings.

GENERAL VIEW OF THE SHAPING PLANER.

This machine has the shaper advantages of quick return stroke; variable speeds and ability to cut to a shoulder are combined with planer accuracy and table capacity. The maximum stroke can be taken anywhere on the table by merely positioning it under the tool without disturbing the work, and this maximum stroke can be taken with the same degree of accuracy as a shorter one.

## Can You Stand Competition?

KEEN competition is the one outstanding feature of business in the machine tool, small tool, iron and steel markets at the moment.

Prices are being cut where it is possible. Machine tool dealers are more or less barred from this practice because they have nothing to do with setting prices. Their schedules are furnished by the makers of these machines.

It is a buyers' market now, and it is going to remain a buyers' market for some time.

Some dealers argue that this keen competition is simply the result of an effort to reduce high-cost stocks.

It is in part, but never lose sight of the fact that the same ability to produce that filled these warehouses is still in existence.

The capacity for making steel in Canada is increasing. Since the war there has been laid down a plate mill in the East with very large capacity. In Hamilton there has just been completed another rolling mill, and at Ojibway there is in process a plant that will turn out a large range of steel and iron.

The automobile plants are becoming more highly organized every week. Their combined capacity, were they running full tilt, would exceed anything we have yet known.

Foundries that specialize are coming into existence. Some of these are million dollar concerns, equipped in the last word of new devices for speed and efficiency.

It all means that there is going to be large production—output on an unprecedented scale.

It means that there is going to be more competition in Canada—not less.

There is nothing theoretical or imaginary in this. Any one who keeps in touch with developments can verify it in his own line.

The firm that is efficient—that serves its customers truly and well—that is so equipped that it can turn out a good, reliable article at a marketable price, will get business.

The machine tool house, or the steel warehouse, that has its fingers on the markets, that keeps its customers well and faithfully informed of what it has to sell, will get business.

If you are not in a position to face stiff opposition in your line, your business future is not certain.

We are having business competition in Canada right now and we are not going to have less of it as days go by.

## The Recovery of Germany

THIS paper has published in the last few weeks the opinions of a number of Canadian manufacturers regarding German trade. It is only natural that the subject should be a very delicate one, but it is more real than delicate and must be faced.

German competition is going to face Canadian manufacturers, whether they want it or not. Our manufacturers have a right to ask for protection against cheap German labor and German dumping, if, coupled with it, goes protection for the consumer.

Charles M. Schwab has returned only recently from six weeks spent in Europe, in which time he made it a point to get in close touch with German trade affairs. He states:

"Germany will recover from the effects of the world war much sooner, perhaps, than any other European country involved in it.

"Germany is a conquered country and her people are aware of it, but they are like a strong man who has failed in business and sets his teeth determined to win back what he has lost by hard work and competent management. The secret of Germany's industrial success was the efficiency of her workers. They still have that efficiency and that training that is necessary to win in the world of commerce and manufacture. Business is bad, of course, in Germany, as in all other countries, including America, but it is on the mend."

Instances are also coming to the surface that show the sort of competition Canadian manufacturers, or any others for that matter, must be prepared to face from Germany. Prices are being named in more cases and these give something concrete on which to base comparisons. An English correspondent writes as follows:

"One example, amidst hundreds given me, with papers and contracts to support it, is quite sufficient. The representative of a big English business house said he had just secured the entire foreign output of the Solingen factory, manufacturing machetes for Cuba, South American and African plantations. The price was $1.50 a dozen up to 10,000 dozen and $1 flat for orders above 10,000 dozen. The best England could do for goods of the same quality was, he said, $2.25 a dozen, with no reduction for large orders. He did not know United States prices exactly, but was positive they were above $1.75 for the same goods."

So there you have it. Canada has not got to face the matter of selling much to Germany, except it be raw material, because German currency is all against such a development. Germany selling to Canada is the real problem. Is Ottawa prepared to deal intelligently with this matter—in such a way that justice shall be done to our industries and no injustice to our consumers?

---

A firm of importers in Trichinopoly, South India, writing to Canadian Machinery, asking for sample copies of this paper, address us as follows: "Canadian Machinery, Montreal, Canada, U.S., America." And so with all that tender care and routing, the letter reached us right side up.

---

The National Association of Purchasing Agents is behind a movement to make a contract sure—a thing that cannot be called off and discarded at the whim of the should-be purchaser. If they can root this sow thistle out of our industrial garden more power to them.

# *Is Russia Ready for World Trade Yet?*

THE matter of opening up trade with Russia is attracting the attention of the world. Several Canadian companies that formerly had big business connections there frankly admit that they do not know very much—if anything at all—about what has been going on since they pulled out.

These concerns are far from satisfied that there is anything sufficiently stable on which to build a trade that would be worth while.

To put the matter short and pointed, their first question would be: Who is going to pay for the goods?

It has not taken Herbert Hoover, Secretary of Commerce in the Harding government, long to make a pronouncement on the question of trading with Soviet Russia.

In the issue of March 22 of the U.S. official Daily Consular and Trade Reports, Mr. Hoover states:

"The question of trade with Russia is far more a political question than an economic one so long as Russia is in control of the Bolsheviki. Under their economic system, no matter how much they moderate it in name, there can be no real return to production in Russia; and therefore, Russia will have no considerable commodities to export and, consequently, no great ability to obtain imports.

"There are no export commodities in Russia to-day worth consideration except gold, platinum, and jewelry in the hands of the Bolshevist government. The people are starving, cold, underclad. If they had any consumable commodities they would have used them long since.

Philadelphia "Public Ledger."

**Little Red Riding Hood Isn't Sure That It's Really Grandma**

### A Period of Destruction

"No better indication of the destruction of production under the Bolshevist system exists than in the case of flax. Pre-war Russia produced 500,000 tons of flax per annum and the country consumed 120,000 tons. The production in 1920 was about 40,000 tons—with mills and lands at least capable of spinning 120,000 tons and the population underclad. In any event, no consequential export flax is available, nor ever will be available, under this economic system.

"Nor can trade with Russia under a government that repudiates private property be based on credit. Thus the whole question from a trade point of view develops into furnishing commodities equal to the gold, platinum and jewelry, variously estimated from $60,000,000 to $200,000,000, in the hands of the Bolshevist government; and after that has been expended there can be little expectation of continued trade. There has been no prohibition on trade for a long time so far as exchange of commodities is concerned. Trade is open through the Baltic States, and Italy has been trading in the South. The real blockade has been the failure of the Russians to produce anything except gold and platinum to trade with.

### Who Owns This Gold?

"There has been but little trade for gold because its title has been called into question by the French Government and by threats of private actions in the courts on the ground that it is stolen or subject to foreign liens. It is apparently the intention under the British trade agreement to allow this matter to be threshed out, so far as England is concerned, in the British courts. The terms of the German agreement in this particular are unknown. If any one European nation accepts the gold, no doubt all of them will.

"Europe cannot recover its economic stability until Russia returns to production. Trading for this parcel of gold would not effect this remedy—nor would the goods obtained by the Bolsheviki in return for it restore their production. That requires the abandonment of their present economic system."

Now there is no doubt a great deal of truth in the stand that Mr. Hoover has taken, and it can be accepted as being the attitude that will be taken by United States, as Mr. Hoover would hardly make such a statement off his own bat.

The weakness of the whole situation is that so many nations in the world are so keen for business with gold behind it, that the prospect of trading with Russia as long as the gold hangs out, will be too strong to be resisted.

---

The man who has been sitting back for months waiting for prices to hit rock bottom has nothing much more to show for it than a pair of shiny pants.

---

Wages paid to the war-shop mechanic are done for in this country. The skilled man, who has seen years of study and whose advice and work are worth while, should have every consideration in wage adjustments. In pre-war years he was seldom paid sufficient to compensate for his years of training and study.

# MARKET DEVELOPMENTS

## More Factories Are Starting to Work

### Pittsburgh Reports a Slight Improvement in Buying, Although Production is Still Very Low—Getting Rid of Stocks is the Chief Business Yet of the Warehouses Here

CONDITIONS in general are undoubtedly moving in the direction of a better period of trading for the machine tool market. Sales are not increasing, nor can it be said that worth-while prospects are on the increase, but there is an improvement in the operations of several of the industries that are the best customers of the machine tool dealers.

There have been a number of reductions in the price of tools since the first of the year, but of late the number of these has fallen off and prices seem likely to stand for the present.

The steel market is the centre of interest for the moment. There are those who want to see the Steel Corporation take the lead and make a new schedule more in line with the present prices of other commodities and again there are those who wish to see prices left where they are. The latter group is composed largely of firms with stocks on hand that they would like to work off in the present market. There are all sorts of rumors in the steel market as to what is likely to happen and when, and in the absence of anything authoritative these are all more or less uncertain, but they all have the effect of making the buyer believe that a better price is coming and in such an atmosphere he is going to buy about pound for pound of what he actually needs.

A number of steel prices have been marked down recently and there has been a drop in tubes, plates, sheets, bar mill material and other small lines. The market as it stands lacks stability and the anxiety to secure business makes any of the prices quoted more or less liable to sagging.

The market for small tools, drills, reamers, cutters, etc., is quiet and sales are made for actual use. Price cutting, according to the dealers, is being freely indulged in and the market is much in favor of the buyer.

There is no rift in the cloud that has been hanging over the scrap metal market for months now. Dealers are practically out of the market, even at the low levels that are in use now and are taking on nothing unless they see right ahead of them a place where they can dispose of it to advantage or to cover a contract.

## MONTREAL REPORTS QUIET WEEK, BUT FAIR SALES IN SOME LINES

Special to CANADIAN MACHINERY.

MONTREAL, March 31.—Industrial conditions during the past week have varied but little from those during the first quarter of the year. The second quarter shows no promise of immediate betterment, but encouraging reports have come in of greater inquiry, usually for small lots, but generally well distributed. One phase of the present situation that tends to develop nervousness is the uncertainty that pervades the railroad conditions, particularly in the relation that exists between executives and the workmen. The possibility of concerted effort on the part of the former to revise the working conditions, and a determined attitude on the part of the employees to reject any proposal of this nature, gives rise to the belief that labor troubles will, during the coming months, disturb the stability of the present quiet, but otherwise sound, industrial outlook. Railroad shops in this district have suspended operations in repair departments for about ten days. Reports from various trade representatives appear to emphasize the fact of industrial dullness, and the consensus of opinion seems to give weight to the statement of one dealer that he "did not look for any marked improvement before midsummer, although light but regular business would continue throughout the spring months."

Commenting on business conditions, a Canadian manufacturer stated: "It is my belief that from now on we will experience changed conditions in commercial activity, particularly in the way of stocks carried. In past years it has been a recognized practice, especially in the retail business, to lay in a three, six or twelve months' stock of commodities, but during the past year this principle has been reversed, the result being that retailers, and even jobbers, are finding it practical and profitable to carry light stocks and replenish their supplies more frequently. Just recently I was informed by a certain retailer that his stock during the past nine months had never exceeded 50 per cent. of what it was prior to the war, and yet the total turnover was but a small fraction below that of pre-war business. This, of course, reacts on the wholesaler or jobber, but more in the size of the individual orders than in the aggregate year's sales." This statement applied particularly to retail business, but it likewise reflects the condition that has existed, and which may be continued, in metal working industries. Manufacturers and consumers will probably be content to operate on smaller "on hand" stocks, working on the basis of covering more frequently. As stated by one dealer here: "The trade has operated on a hand-to-mouth system for many months back, so that the idea has become a habit, and it would not be surprising to see this attitude a feature of future trading, especially as long as present uncertainty dominates the situation."

Steel plate movement has declined in volume; railroads and shipyards are taking less material, the order for the day being for single plates rather than for tonnage supplies. One tank manufacturer here stated that their business was

quite good with work on the books for several months ahead. Spring activity is expected to add to the sheet demand. Revision has been made in quotations on sheets. No. 28 black has been reduced to 6½ cents, while blue annealed are quoted at 5½ cents. Galvanized sheets are lower, the prices now being 8¾ cents for No. 28 and 5¼ cents for 10¾ oz. Queen's Head and Fleur-de-Lis have also declined.

**Keener Competition in Selling Tools**

That business in this locality is not as bad as in many of the large American centres was shown in a statement by a United States business man this week, here on a visit to their Canadian representatives. He said: "'Business conditions here are much more satisfactory than in the States. Many of your plants here are running on short time, some of them even with reduced staffs, but over there a great many factories are closed down entirely, and have been for some time, with little hope of early betterment. I find that sales here of our products are relatively much better than at home." Some activity has been reported in the way of machine tools, mostly for new lines to be manufactured or where new departments are being opened by engineering firms. Marine shops are preparing for a busy season. One firm here, not previously engaged in this work, has established a marine repair department, and additional machines have been installed for carrying out the work. The general tool demand is quiet, and supply movement shows a little falling off, with keener competition featuring the selling market.

## POINTS IN WEEK'S MARKETING NOTES

**The big question in the steel market this week is regarding the attitude of the Steel Corporation on its price schedule. Some reports say that this will come out on the 15th of April, but there is nothing official about this.**

—

**The Steel Corporation is producing this week at between 40 and 43 per cent. of its capacity.**

—

**Pittsburgh says that bars are selling at 2 cents in carload lots.**

—

**Pig iron is selling at $25 at Pittsburgh, and some sales have been made at $1 under that mark.**

—

**The warehouses in Toronto district are quoting iron and steel bars at 4 4½ cents per pound.**

—

**There is a very small demand for plate, and warehouses here are quoting $4.75 for 3-16-inch.**

—

**The sale of small tools is going on in very limited quantities, consumers buying only what they need from day to day. Several of the dealers were complaining this week that prices were still being cut. As the market stands it is very much in favor of the buyer.**

—

**There is no improvement in the scrap metal situation this week. Dealers will not guarantee to pay the prices quoted on another page of this paper. Many of them are out of the market entirely.**

## MARKET REMAINS RATHER "SPOTTY"

**Price Conditions Have Quite a Bit to Do with Sales—Price Cutting Is Being Indulged in**

TORONTO.—The used machine is still figuring quite largely in the Canadian market, especially in the woodworking field. In fact some of the dealers are doing a very good business.

The metal working machine tool trade is quiet. Some sales are being made, but they are not large, and inquiries are not as promising as they were a few weeks ago. The matter of prices may or may not have something to do with the matter of sales not being closed. It still provides the would-be purchaser with a talking point, though, and there are times when he makes the best of it.

Dealers have had many notices of reductions in the prices of machine tools since the first of the year, and there seems to have been a let-up in the movement during the past week or so. One of the firms was making comparisons in the prices of lathes now and at previous times, finding that one well-known maker, in his last price list, which included a reduction of about 15 per cent., had almost duplicated the list which had been issued for 1918. Of course the 1918 prices are well in advance of the 1914, but it is not held in any quarter, as far as we can find out, that there will be a return to anything like that price. As is always the case, when a price is cut, the question that comes first to be answered is, "Will there be another reduction?" Getting the machine tool market established on anything like a working basis, where buyers will have confidence in prices, is quite one of the largest problems that the trade is facing now.

One well-known machinery house told this paper to-day that the month just closing was one of the best they had experienced in used equipment, especially for woodworking shops. He attributed this to the fact that building is getting under way in a good many of the centres where costs are not quite as excessive as they are here. Then he considered that the price had a great deal to do with it. Some firms were anxious to increase their output slightly, and did not feel able to take on an extensive line just now. They were turning to the used tool market.

Motors, this same firm claimed, were moving out slowly at present. Some weeks ago there was a reduction of about 7 per cent. in this line, but prices are weak, and the trade seems to think there is going to be another break.

**In the Steel Market**

Many of the warehouses are still busy liquidating their stock, and there is not a great deal of money being made in this business. There is a growing expectation, and one hears the story many times, that the selling schedule of the Steel Corporation is to be revised downward. Officials of the company in Canada who would be likely to know, were any information being given out, claim they have heard nothing about it. But the story runs something like this, as Canadian Machinery heard it in several places to-day:

"Corporation prices are going to be altered and the new schedule will be given out on April 15, when it will be seen that bars will be down to 1.75." April 15 is not far away, so it will soon be seen whether or not this guess is good for anything.

One merchant declared that he was quite satisfied to see the Corporation price stay where it is. "Were a cut to be made, it would mean that we would have to write off a good-sized sum on every ton in our stock, and there is quite a bit of material there that was brought it from the premium mills. Of course, it may be that when buying starts prices will improve, and we will get some of the loss back, but it is a chance in business that we must all take. We can't win all the time. Certain it is there are few wins to be scored in the present market."

**Sheets Fairly Active**

A fair business is being done in sheets, particularly galvanized. Some of the stove makers have been taking in a fairly good tonnage from the jobbers this week. This may mean that the stove business is very poor, and that they would rather let the warehouse take the chance on a price, and they buy in small quantities rather than stock up from the mills themselves.

This is hardly the season for plate, but very little of it is being sold. We quote plate from warehouses at 4.75 for 3-16-inch and 4.25 for ¼-inch and up.

The competition for business in bar mill material is still keen, but dealers do not show quite the same eagerness to put nicks in their prices as they did a few weeks ago. We are quoting iron and steel bars at 4.25 this week, although it is known that some of the warehouses

are doing four cents on anything that looks like a desirable order.

Black sheets are quoted at 6.50 for 28 gauge, and blue annealed at 5.50. Galvanized 28 at 8.50 and 10¾ oz. at 8.90. These prices may be regarded as fairly indicative of the market, although we are willing to admit there may be several cases in which a figure more favorable to the buyer has been quoted.

Tubes are moving out on a fairly good basis. Prices have been revised downward this week, and local warehouses for the most part are quoting $40 for 100 feet of three-inch lapweld and $49.25 for seamless. The repair business in boilers seems to be keeping up in fairly good shape. Every effort is being made to make existing equipment do for a while longer.

### Small Tool Market

There is not much business going to the dealers in small tools just now. Although some of the firms that are generally counted upon to use large quantities of this class of supplies are getting under way they seem to be fairly well stocked. Competition continues keen for anything in the way of a decent sized order, and some of the dealers are always ready to tell a yarn about the way some of the prices are being pared in order to take home an order. Files, too, are being sold in somewhat the same way, some of the jobbers going so far as to claim that some makers are giving prices lower than those that could be obtained for them by the jobbers.

---

## AUTO PLANTS ARE RUNNING BETTER

**And From This the Machine Tool Market Sees Encouraging Signs For the Future**

Special to CANADIAN MACHINERY.

NEW YORK, March 31.—While there is undoubtedly a better tone in the machinery markets, this is not yet reflected in any important increase in orders. Inquiries have improved, both as to number and volume, but prospective purchasers are slow in closing. A distinctly better condition is apparent in used tools.

There are three large lists still pending, and just how soon action will be taken is not known. The American Sugar Refining Co., which recently inquired for about fifty machines for a repair shop at its Baltimore, Md., refinery, has given some indication that it may place orders within a week or two on at least a part of its list. The Batavia Car Works, Batavia, N.Y., is expected to buy mostly used tools. Its list called for about twenty-five or thirty machines. The General Electric Co., which two weeks ago issued an inquiry for thirty miscellaneous machines, may not buy all of the machines on this list. It has been found that its requirements at Schenectady can be met in part by moving machines from one department to another. Just how extensive its purchases will be, therefore, remains in doubt.

The declines in prices which have recently taken place have affected nearly all important types of machines, but not all manufacturers have reduced. Many of the lathe builders announced reductions within the past week and the milling machine makers are mostly on a lower price level. Some business has been placed, which may be almost directly traced to price reductions. The need for the machines was not so urgent but that prospective buyers could afford to wait for the reductions which they felt were sure to come sooner or later.

The machine-tool trade gets some encouragement from the improvement in the automobile industry. While it is not expected that there will be any early buying of tools by automobile manufacturers, themselves, the resumption of automobile manufacturing on a normal scale will have a decidedly beneficial effect on business sentiment generally and will be the means directly or indirectly of releasing some orders for tools. The Ford plant at Detroit is now turning out 3,000 cars a day, which is about 75 per cent. of its capacity. The Franklin plant at Syracuse, N.Y., is working close to 100 per cent., while the Studebaker, Buick, Dodge, Cadillac, Dort and other plants have shown recent betterment in operations. Automobile parts manufacturers have benefited to a slight extent, though many of the automobile companies are said to have fairly good stocks of finished parts and raw materials.

## PITTSBURG EXPECTS CORPORATION TO REVISE ITS PRICES—BUT WHEN?

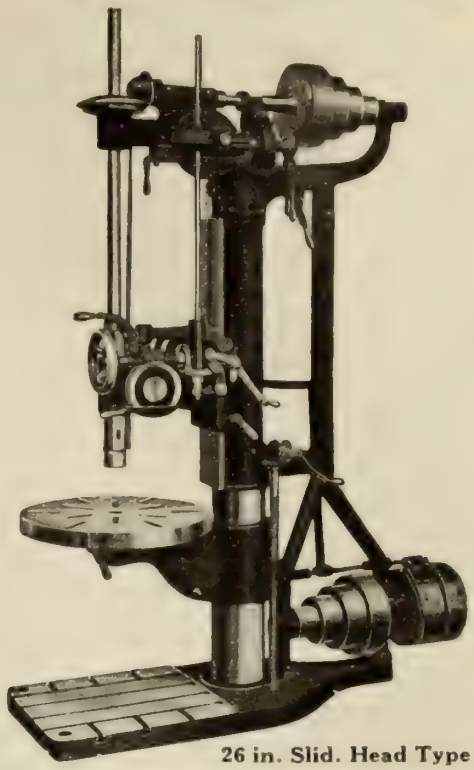
Special to CANADIAN MACHINERY.

PITTSBURGH, March 31.—About three weeks ago the first signs of an increase in demand for steel products appeared, and the experience now accumulated is that the improvement is of extremely moderate proportions. No one is disappointed, for very little was expected. The only point about the improvement is that the turn has been rounded. Business has not become so good that there is any danger of its going the other way, for it has scarcely any room in which to grow worse.

Since the first of the year the question has been whether there would be a spring buying movement. There was no serious expectation that the turn of the year would bring increased activity, but there is almost invariably an improvement in spring, unless the business has been done in advance. Probably there is now a tendency for business to expand, the tendency being checked by recognition of the fact that steel prices are not yet adjusted to a basis that would likely prove more or less permanent.

There is much discussion of the United States Steel Corporation's attitude on prices and its probable action. The independents, although a couple of months ago they began on a rather broad scale to cut the Steel Corporation or Industrial Board prices, have not even by this time made a definite and stable market. Independent prices went down sharply for two or three weeks and since then they have scarcely been sagging. The level is fairly well defined now, but it is not established by buying. It is chiefly a carload market, with plain indications that on large lots some of the independents would make further concessions, of indefinite amount. Thus there is no established market, and there is no tendency for the market to seek a definite and stable level. In the circumstances it is recognized everywhere that the matter is left for the Steel Corporation to settle. The real market will come when the Steel Corporation acts. It does not follow that the prices the Steel Corporation names will become absolutely the market. Independents may cut those prices slightly, or they may be unwilling to go altogether as low. Or, some may cut the prices and some refuse to meet them. Nevertheless, the Steel Corporation prices will, according to the common view in the trade, represent the market in general, furnishing a schedule in which buyers can have considerable confidence.

The Corporation has not acted and there is no indication as to when it will act. Some men, chiefly outside the trade, have criticized the Corporation for not acting, while many, chiefly within the trade, warmly commend the Corporation's course as being the wise one. Those who criticise the Corporation speak as if business would develop if the reductions were made.



This divergence of opinion arises from confusion between cause and effect. A reduction in prices does not cause people to buy unless they are ready to buy. When people are ready to buy and expect lower prices, failure of prices to decline will cause them to delay buying. The proponents of a price reduction by the Steel Corporation have assumed that price reduction would cause buyers to take hold. Those in the trade are convinced that buyers are not ready yet, and assume that when the Steel Corporation see that buyers are ready it will reduce prices. In other words, a disposition on the part of buyers to take hold must be regarded as a cause for the Steel Corporation to reduce prices, not a result of its doing so. Hence the proper view to take of the present situation is that the Steel Corporation is

waiting until buyers are ready to take hold. Then the Corporation will reduce prices and will be glad that the occasion, now being waited for, has arrived. To reduce prices before the buying disposition is developed would be to waste an important psychological influence. Besides, a great many customers of the Corporation do not wish it to reduce prices. They have stocks of raw material and manufactured goods to work off.

### Production

Week before last it was estimated that the Steel Corporation was down to a 45 per cent. operation. That estimate, which was quite general, proves to have been incorrect, as the Corporation actually produced steel in the week at 49 per cent. of capacity. Last week, however, it may have gone down to a 45 per cent. rate, as the general tendency of the Corporation's operations is a declining one. The independents have continued to peg along at an average of about 20 per cent., though there are numerous changes in the active list. One mill may close for a week or two while another resumes. Newspaper accounts of mills resuming or closing must not be taken at face, as in some cases the resumptions are emphasized and the stoppages omitted, or vice versa.

Assuming the correct percentages of present operations to be 45 per cent. for the Steel Corporation and 20 per cent. for the independents, the Corporation is producing steel ingots at the rate of 10,000,000 tons a year and the independents at 6,000,000 tons, making 16,000,000 tons altogether, or about 30 per cent. of the total, while the Corporation would be making 62½ per cent. of all the steel. The Corporation has about 43 per cent. of the capacity. In 1919 it made 51 per cent. of the steel and in 1920 about 48 per cent. Its annual report for 1920, just issued, shows that it made 14,532,646 tons of pig iron, 19,277,960 tons of ingots and 14,228,502 tons of steel products for sale. The total steel ingot production of the country may be estimated at between 40,000,000 and 41,000,000 tons, the official figures for 1920 not being compiled as yet.

### Prices

Bars, shapes and plates are practically unchanged. For several weeks they have stood at 2c for bars and 2.10c for shapes and plates, in carload lots with desirable specifications. On large lots concessions could be secured, but hardly as large concessions as seemed possible a month ago. Black sheets remain at 3.85c, while galvanized can be done at 4.90c about as readily as they could be done at 5c a fortnight ago. Tin plate remains at $7 as the mill price. The deadlock has not been broken and consumers are buying very sparingly. They can buy at second hand from stocks at between $5 and $6 and they can also buy imported plates, from stock, at about $5, New York, but the loss and expense in cutting down would add to the actual cost and these stocks do not move freely.

Standard steel pipe is now added to the list of steel products on which concessions are obtainable from the Industrial Board or Steel Corporation schedule, making the list complete with the exception of tin plate. Several independent mills will readily give an extra 2½ per cent. discount on standard steel pipe, equal to about $2 a ton, while it seems that in a few cases an extra 5 per cent. has been given.

### Pig Iron

Foundry pig iron is now offered at $25, valley, or $1 decline, malleable being also offered at this price. In basic pig iron the market was quotable nominal for several weeks, on an asking price by the merchant furnaces of $25, valley. Now there has been a definite change, in that the steel works, offering pig iron out of stocks they were awkward enough to accumulate as they were slowing down their operations, will sell at $23, and a few small sales have been effected. The merchant furnaces have decided not to follow the market, but to stand aside until the steel works have disposed of their accumulations. The $23 price is below the merchant furnace cost, and may even be a shade below the cost of replacement by steel works without counting overhead, but the steel works see an advantage in selling out of these stocks, because when they need pig iron they can make it and use molten iron in steel making, saving the cost of remelting.

# GRATITUDE IS THE EXPECTATION OF FAVORS THAT ARE STILL TO COME

HE wasn't in a particularly good mood about the thing when we called the other morning, and before anything was done he talked, and using the proper and well recognized way of doing things, we record what he said:

"Well can you beat that?"

"Beat what?"

"Well, not so very many weeks ago a couple of chaps came in here, and wanted us to start them up in business. They had both of them had considerable experience in the woodworking business, and seemed to be anxious to get to work and do something. They secured a contract for making up some cheap furniture, enough to keep them busy for the next few months, and it was on top of this contract that they wanted us to stake them to the plant. We went into the matter carefully, and in order to give them a start, we decided to go ahead.

"I can tell you this, that no person ever got so much equipment out of this place on such a small payment. Well, to cut down on the in-between stuff, they got started, and have been going along pretty fair ever since, and have picked up a couple of other little lines that can be done on their same equipment. Well, they wanted some little thing the other day, and one of them came in here to find out what it was worth. He wasn't looking for a plant any more. He was a full-fledged mill owner.

"I told him what it would be worth to put it in, and about how long he would have to wait, when he broke in with, 'Never mind about that. We don't think we'll buy anything more here. You've been getting enough of our business for a while.'

"It took me quite a little while to get enough wind to remark that it might be good policy for us to collect for what we had sold before letting them have anything more,—but what's the use? The chances are that man will get along."

# NO BRIGHT SKY IN WASTE METALS

**Dealers Declare That Even Lowly Price Schedule Fails to Move Material**

There has been nothing come to the surface yet that would make the scrap metal trade look any better. If such a thing were possible, the tendency is still to shove prices down to a lower level. A glance at the schedule would show anyone that the figures will go up as soon as there is anything in the line of a demand for material, for until the demand comes prices stay in the cellar.

"For all intents and purposes we are out of the market," stated one of the largest dealers this morning. "Even at the figures you are quoting it is doubtful if we would take on anything at all, unless we could see where we were going to dispose of it almost at once."

Yards state that neither the steel mills nor the foundries, which are their largest buyers, are taking on anything.

The whole waste material trade is depressed the same as the metal end of the business.

# GOOD NEWS FOR THE RAIL MILLS

**Work On Extending The T. & N. O. Will Be Gone On With This Season**

Cochrane.—George W. Lee, chairman of the T. & N. O. Railway Commission, made the statement here that the surveys in connection with plans to extend the railway north from Cochrane toward James Bay will be gone ahead with immediately. It is planned to complete all surveying so as to proceed with the first 70 miles of the extension about next fall.

Among other things, the line will touch Kettle Falls on the Abitibi River, where a large hydro-electric plant may be installed for the purpose of operating pulp and paper mills, as well as providing power for the electrification of the T. & N. O. Railway.

Cochrane business men are enthusiastic about the contemplated development and the extension of the railway, and the present step is believed to be ultimately designed with the object in view of finally continuing right on to tidewater at James Bay.

## Pig Iron Market

Pig iron has been further reduced during the week. More blast furnaces are going out and the Steel Corporation's curtailment of pig iron output has been rather rapid. The appearance of three definite inquiries for round lots of the steel-making grades on the Pittsburgh market has developed a competitive market between merchant and steel plant offerings. A merchant producer with furnaces in the Valley reports a sale of 1,000 tons for immediate delivery at $25, but against this is one of a similar quantity to a Valley steel maker from one of the Valley steel plants at a price of $23 furnaces, while the Allegheny Steel Co., which has an inquiry out for 1,000 tons each of basic and Bessemer, is said to have been quoted $23 and $25 respectively on these grades. Practically nothing has been done in the past week in foundry iron, and the price has become nominal.

The only large inquiry before the trade at Chicago is that of a Wisconsin melter who recently bought two 2,000-ton lots of Northern foundry at $26 delivered. The American Radiator Co. has bought 300 tons of Southern foundry 2.25 to 2.75 per cent. silicon at $25 base Birmingham for its Detroit plant.

A slight improvement is noticed in the demand for foundry iron for prompt shipment on the Cleveland market. With the exception of one small lot of malleable iron, all the sales were in foundry iron. A local producer has reduced its price $1 a ton to $26 for No. 2 foundry for outside shipment.

Buffalo reports that a local furnace has been approached from two sources and asked to name a price on a large tonnage of pig iron unquestionably for speculative purposes. From this it is believed that certain speculators believe that the bottom has been reached and that it is a good time to buy. Sales are no better.

## Scrap Metal Market

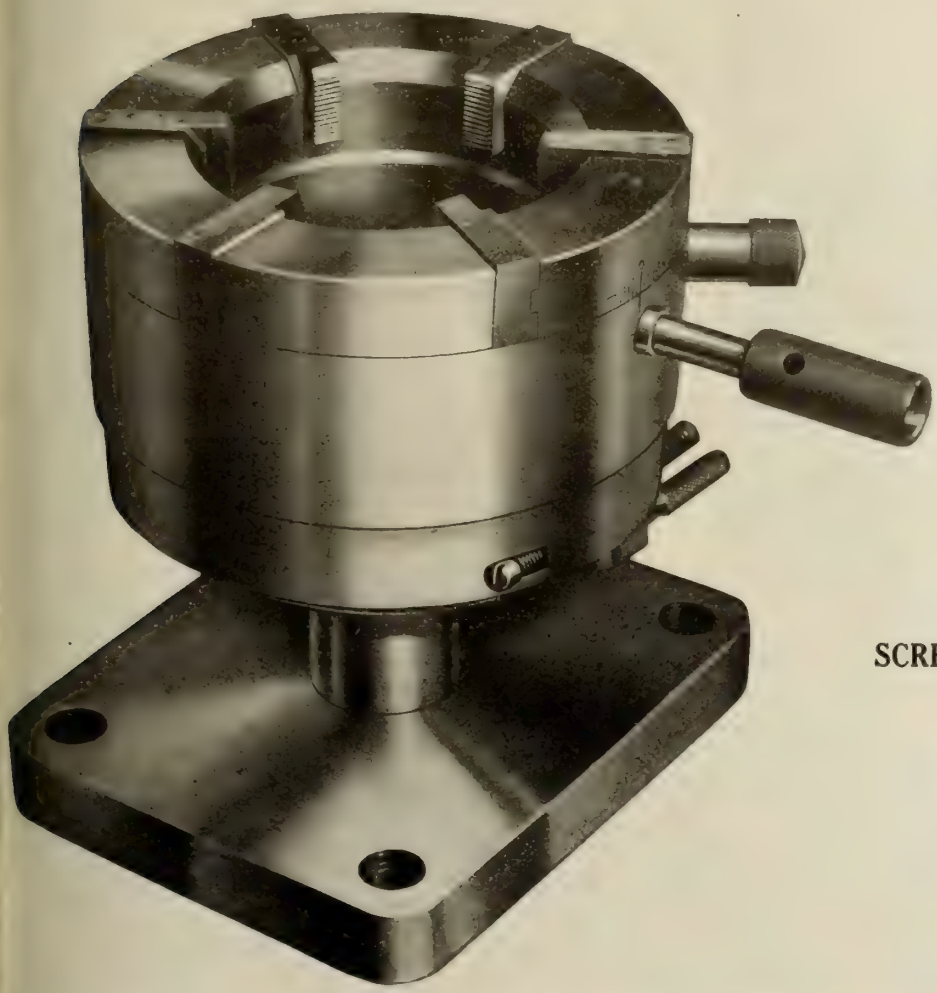
There has been a sharp decline in prices during the past week. Trading is practically at a standstill and some large declines are being forced.

Philadelphia reports that iron and steel scrap is now selling at prices netting the sellers more of a loss than at any time in history. Several hundred tons of heavy melting steel scrap were sold last week at $12.75 delivered, and several small sales were reported on other grades.

The absence of buying on the New York market is bringing further declines in practically all materials with the exception of cast material. The declines range from 50 cents to $1.50.

On the Pittsburgh market buyers will not take tonnage except at prices so ridiculously low that they become unattractive to dealers. The Pennsylvania railroad recently sold some steel axles a little above $18 and hence this grade has dropped from $22 and $23 to $18 and $19.

The scrap market has found a new level at Buffalo with heavy melting steel at $11.50. One buyer in this district is offering no more than $10 and insisting on No. 1 grade with strict inspection, but not much selling is being done at this figure. There is a little business being done in stove plate, about 500 tons being sold in small lots at $19.



Dealing has been almost wholly lacking at Cleveland, and the quotations that were regarded as bottom are now discarded. Reductions have been made all along the line with the exception of one or two grades.

There is a little keener demand, and heavy melting steel is slightly higher on the Detroit scrap market. The market in other lines is dull. Conditions are brightening in the Detroit automobile plants and dealers are looking for better conditions to result in scrap.

## Engineering

A garage is contemplated by John O'Grady, 84 Osgoode Street, Ottawa, Ont.

The Three Hills Milling Co., Three Hills, Alta., are planning to erect a flour mill at cost of $30,000.

A warehouse will be erected by Irving Wood & Co., 2907 Dundas Street West, Toronto, at a cost of $20,000.

Black and Irish, 606 Merchants Bank Building, Winnipeg, Man., are contemplating the erection of a garage.

Plans for alterations to the Kay Building, Toronto, Ont., are being prepared by F. H. Maranit, architect, Manning Chambers.

The Butterfly Hosiery Co., Drummondville, Que., contemplate the erection of an extension to factory at a cost of $300,000.

A plumbing shop and public hall are being built by H. Massicotte & Freres, Inc., Cap de la Madeleine, Que., at a cost of $10,000.

The Royal Brush Co., Hamilton, Ont., is asking for a small second-hand planer, 16 or 18-inch, with long bed; also cut off and rip saw.

The National Castings, Ltd., Belleville, Ont., will start work in the near future on the erection of a foundry and other additions.

Royal Drug Exchange, 51 St. Joseph Street, Quebec, Que., has purchased the building and will transform it into a large pharmaceutical warehouse.

The Mimico-New Toronto Joint Sewage Commission, Mimico, Ont., will purchase pumps of 2,000 and 1,500 gallons per minute capacity for a pumping station.

The Supercharge Engine Co. of Canada, Ltd., 120 St. James Street, Montreal, will receive bids for the erection of a plant and will purchase the necessary equipment.

The Temiskaming & Northern Ontari Railway Commission, 56 Church Street, Toronto, will build shops and engine houses to cost about $80,000 and will spend $57,500 on equipment.

The contract for the erection of office and brass foundry for the Taylor & Arnold Engraving Co., 260 St. James Street, Montreal, has been awarded to W. H. Madigan, 949 Atwater Avenue.

The Engineering & Machine Works of Canada, Ltd., St. Catharines, Ont., desires a high embossing type press for making ½-inch letters and figures for numbering wood patterns.

The machine shop, boiler house and forge of the Nova Scotia Steel & Coal Co.'s shipbuilding plant at Trenton, N.S., recently destroyed by fire with a loss of $60,000, will be rebuilt at once and new equipment purchased.

The Gove Motor Co., Tilbury, Ont., will start work about April 1 on the erection of factory to manufacture automobiles and trucks and will be in the market for metal-working machinery and special equipment.

The Dods Knitting Co. will build an addition to their factory in Orangeville, giving them an additional 20,000 feet of floor space.

Construction will begin next month on the new pulp and paper mill at Kenora, Ont., for E. W. Backus, of International Falls, Minn. Five hundred men will be employed on construction work.

Thos. Sharpe, Avenue Block, Winnipeg, Man., has been awarded the contract for erection of a garage at cost of $80,000 for Consolidated Motors, Ltd., corner Portage Avenue and Victoria Street.

**Enlarging Plant.**—The Peterborough Gas Works are building an extension to their plant, which will, when completed, give double the capacity of the present purifiers. The Economic Gas Construction Co., of Toronto, have secured the contract for this work.

**Wants Equipment.**—A correspondent wishes to know who can supply him with a machine for making buggy and perambulator wheels, these to range from 4 inches to 18 inches diameter. He also asks, "Who can supply the material for these wheels; ribs, spokes, and rubber cushions?" Any firm interested in this request can secure further information by writing the editor of Canadian Machinery.

**Looks for Good Year.**—Fred Armstrong, president of the Port Hope Sanitary Manufacturing Co., reiterated his belief at the annual meeting that the present year would witness a large volume of building throughout Canada. He, however, emphasized the importance of amicable relations between employer and employee. Only routine business was transacted at the meeting, and the former directors were re-elected as follows: L. M. Wood, R. J. Cluff, W. D. Ross, Fred Armstrong, M. L. Davies, Robert Fleming and W. J. Cluff.

**Going to Start.**—Speaking to a representative of this paper, James Hamilton, managing director of the Peter Hamilton Co., Peterboro, engaged in foundry and machine shop work, stated that the foundry end of the business, employing about twenty men, which has been closed for a month due to lack of orders, will reopen in the course of the next few days. Mr. Hamilton believed that the general slump, under which business has been laboring for the past few months, is due for a break, and he is quite hopeful that the coming season will be a good one for business in general.

## Personal

T. A. Hollinrake, president and general manager of the A. R. Williams Machinery Co., has been spending the last couple of weeks at Atlantic City.

Willys-Overland, Limited, are announcing an appointment of special interest in automobile circles, in the selection of H. E. Brasier as manager of the Toronto Branch, succeeding H. D. Scully, who has resigned to take up other important work. Mr. Brasier has been service manager for Canada for some years, and is widely known throughout the whole Canadian Overland organization. He will have a field for which he is particularly adapted owing to his large acquaintance in the city. He was connected with the bicycle industry first, and later joined the Russell Motor Car Co., where he was for several years accountant at the Toronto Branch. When this company was taken over by the Willys-Overland, Ltd., his good work led to his appointment as service manager at the head office.

## Montreal Notes

The Lyman Tube and Supply Company have been appointed Canadian distributors for the "Hoffman" ball and roller bearings, manufactured by the Hoffman Manufacturing Company of Chelmsford, Essex, England.

* * *

Roderick McLean, engineer, 128 Bleury St., Montreal, has secured the Canadian agency for the Cleworth, Wheal and Company, of Castleton, England, manufacturers of air filters, humidifiers and water coolers.

* * *

R. Percy Sims, consulting engineer, of Montreal, is moving his office from 424 Philips Place to more commodious offices at 358 Beaver Hall Hill. This firm has the contract for the refrigerating plant of the new cold storage warehouse being erected for the Montreal Harbor Commissioners.

* * *

Both the Angus shops of the C.P.R. and the Point St. Charles shops of the Grand Trunk have been closed down for a period of about ten days owing to the lack of work in the way of locomotive repairs. It is expected that some proposition will be made to the men in the near future regarding a revision of the working schedule and the rates of wages.

* * *

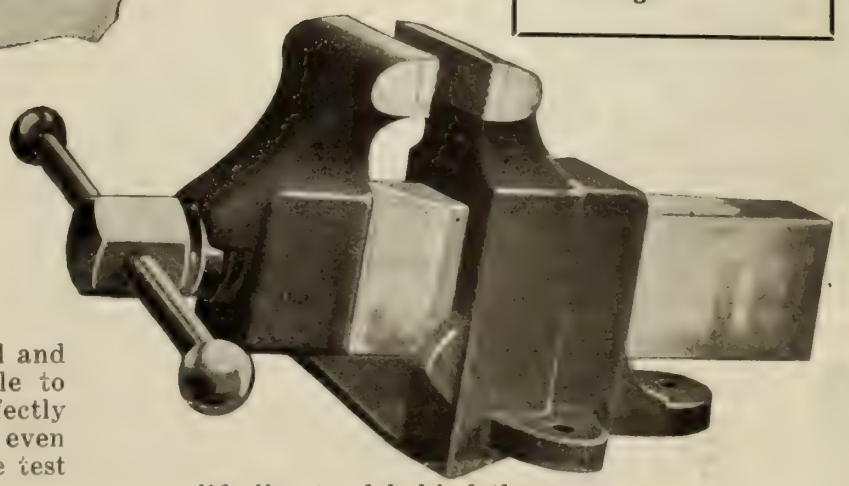
The engineering firm of G. and J. Weir, of Montreal, have added a new department to their business. This section will take care of the repairing of vessels plying to and from the port of Montreal, and a thoroughly experienced staff of workmen and an efficient superintendent from the parent plant will look after this division of the work. Work on the new foundry of this firm has been started, and it is expected that the plant will be in operation before the middle of the summer. This firm has considerable work booked ahead, and full time operation is looked for throughout the season.

# MacFARLANE Portable Floor Crane

## *The Biggest Labor-Saver in the Plant*

MACFARLANE Portable Floor Crane and Hoist has a capacity 2 to 6,000 lbs. Cut illustrates the industrial types with high base and large wheels; it is easy moving and can be operated by one man at full capacity.

Equipped with Hyatt Roller Bearings.



THE LARGEST TYPE OF HOIST is similar except for base casting, which is lower, to allow machine being placed under axles of car and in such places where little height from floor is experienced.

MADE - IN - CANADA AND MADE BETTER

*The* MacFARLANE LINE

**Portable Floor Hoists and Cranes.**
**Machinists' Vises of all types.**
**Trolley Wheels.**
**Oilless Bushings.**
**Heavy Duty Winches.**
**Grey Iron Bronze and Aluminum Castings.**

## MacFARLANE *Quality Vise*

Machinists' Vise — a solid, sturdy tool; the main casting is entirely of semi-steel and jaws of high carbon steel fused in place. Balls are of steel and so arranged that it is impossible to remove them. The teeth are perfectly milled and possess a perfect, even grip. All vises undergo a severe test before leaving the factory; thus we can unqualifiedly stand behind them.

We manufacture all types of vises, including the quick-acting vise.

# U. S. AUTO PLANTS READY TO PUT PRODUCTION AT CAPACITY

Detroit.—One hundred per cent. production schedules will be put into effect in practically every automobile plant in Detroit, beginning next Monday, it was learned in a canvass of the factories.

Manufacturers are optimistic over the future of the industry. Almost every plant reported orders coming in rapidly. Men are being hired every day, and departments are being built up to a normal basis.

The Paige Detroit Motor Car Company will resume full time production Monday.

Officials of the Hupp Motor Car Co. said that production will be increased to normal next Monday.

### Increase 50 Per Cent.

Production in the Hudson and Essex plants will be 50 per cent. greater in April than it was during March, an official stated. The company acknowledged that it has more orders on its books at present than it can fill in the next 60 days.

All plants of the Studebaker Corporation, which have been running on a five-day-week basis, will be operated six days the first week in April.

During April production in the Packard plant will be 50 per cent. greater than it was during the last three months. In May it will be increased to 100 per cent. more than during January, February and March.

### Open New Plant

The new plant of the King Motor Co. will be opened next week.

The Maxwell Co. will increase production to a 45 per cent. basis next week.

Production in the plant of the Chalmers Motor Car Co. will be 75 per cent. greater during April than in March, said one official.

Officials at other plants, although admitting that production will be increased April 1, refused to give actual figures.

The Ford Motor Car Co. has received orders for 90,000 cars to be delivered in April, as against about 80,000 in March.

# OSHAWA PLANTS WELL UNDER WAY

**Operations There Have Been On The Increase and Unemployment Has Almost Ceased**

According to an Oshawa man, conditions in the automobile plants in that town are constantly improving, and the McLaughlin, Chevrolet and Oldsmobile shops are all running. The rate of production, of course, is not up to normal, but it is increasing. "I have no definite figures," said our informant, "but I should say that around 60 per cent. at least would be their present rate of operation."

"Another thing that we can judge by," he said, "is the unemployment, which has practically ceased. Some of the men who were skilled in certain lines of work in the auto shops who were let out some months ago have been brought back to work, and some time ago all the married men had been given their places back. Fittings Limited is also working on a fairly good basis, and they must have about 80 per cent. of their normal staff at work now. Indications are that things are moving along in a much better way than they were a few months ago, and there is a feeling that business is very much on the mend."

# RECENT CHANGES MADE IN PRICES

**Some of the Firms That Have Announced Reductions in Their Schedules**

Reductions of about 15 per cent. on Kearney & Trecker, Kempsmith and Hendey milling machines are reported. Cincinnati and Brown & Sharpe were reduced some weeks ago. The Canedy-Otto Mfg. Co. has reduced prices about 15 per cent. on its line of radial and upright drills, forges, grinders, etc. The Champion Blower & Forge Co. has announced reductions approximating 10 per cent. and the Royersford Foundry & Machine Co. has cut 10 per cent. on its punching and shearing machines and sensitive drills. Reductions on some lines of lathes are also reported and a Western maker of vertical boring machines has reduced prices about 20 per cent.

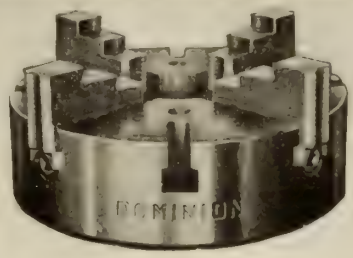
# EXTEND PLANT AT FORT WILLIAM

**Canada Iron Foundries May Make Extensions and Go in for Wheel Making**

The location of a wheel-making plant to cost $150,000 as a subsidiary of its present plant in Fort William is in contemplation by the Canada Iron Foundries. Major Hughes and C. J. Jobb, of the Montreal offices of the company, met the mayor and aldermen of Fort William regarding the proposed new unit. The aldermen noted that the company's fixed tax assessment expires this year. In requesting a renewal the members of the company pointed out that the company is prepared to go ahead with the building of the wheel-making plant when the council is ready to submit a proposition setting out what the city is willing to do.

In 1920 the company paid out in wages at its Fort William plant over $260,000.

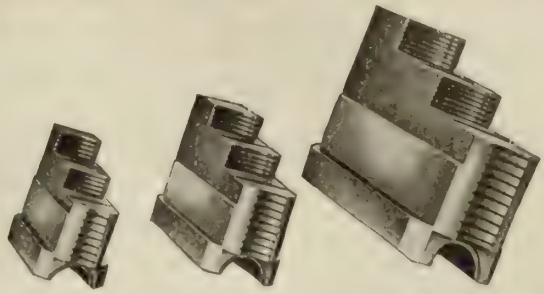
## ALGOMA WANTS TO GET BUSINESS



**Steel Mill Needs Orders for Rails — Many Men Out by Shut-Down of the Mills**

Sault Ste. Marie, Ont.—A deputation comprising Mayor Thomas Farquhar, President J. A. Hussey of the Board of Trade, and A. E. Whiteal, president of the Trades and Labor Council of this city, went to Ottawa to wait on the Government to ascertain if something cannot be done toward getting orders for the Algoma Steel plant, which let out a great number of its employees for lack of orders for steel rails. It is estimated that nearly 2,000 men have been walking the streets here out of employment, and that unless orders come in to the Steel Corporation the prospects for the coming summer will not be very bright for the men.

### PIG IRON PRODUCTION



The 1920 pig iron production of the United States was 36,925,987 tons as compared with 31,015,304 tons the preceding year, according to official statistics of the American Iron & Steel Institute, just announced.

Output in 1918 was 39,054,644 tons and in 1917, 38,621,216 tons. Production of 39,437,797 tons in 1916 was largest in history of the industry. Largest production in any pre-war year was in 1913 when output reached 30,966,152 tons.

DOMINION CHUCKS

STEEL OR CAST-IRON BODY
BUILT FOR HEAVY DUTY

The Jaws Are Extra Strong

THEY are drop forgings, made of best quality steel, heat-treated and hardened. The threaded portion of jaws form a half nut for the setting-up screws. Have stood the test of heavy duty work in our own shops where accuracy was the only accepted standard.

# Classified Opportunities

## ATTENTION!
## JOBBERS and DEALERS
### Engineering Supplies

There is absolutely no reason for paying exchange on your purchases of asbestos packings, gaskets and tape. We manufacture a line that is equal to any imported article and sold to jobbers at a price that allows a good margin of profit with protection. If you are not handling our line you are working at a disadvantage. Write us for set of samples, circulars and prices.

**OUR LINE INCLUDES:**

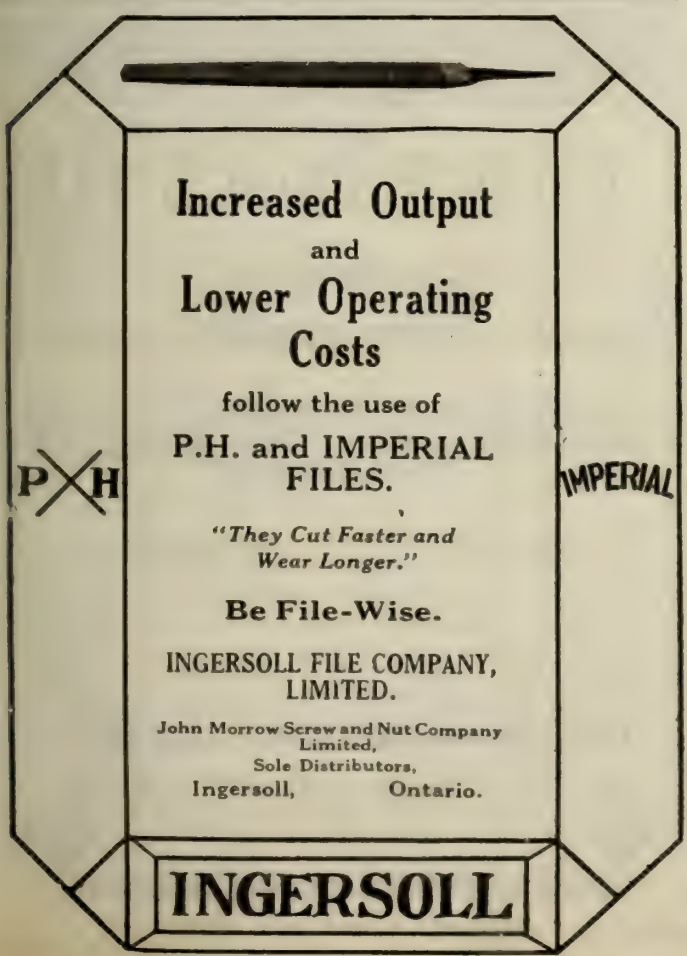
Tiger Superheat Metallic Piston Packing
Tiger High Pressure Piston Packing
Flax Packings
Asbestos Gaskets
Asbestos Tape

**GUILDFORD & SONS LIMITED**
HALIFAX, N.S.

---

**Mr. Purchasing Agent, would you like to hear of some special bargains in new and used machinery?**

## Of Course You Would



Then it will pay you to watch this advertisement from week to week, as we specialize in all kinds of iron and woodworking machinery, together with a full line of contractors' and mining equipment.

Send us a list of your requirements and we will convince you that our prices are right.

**We are open to buy**

# GARLOCK-WALKER LIST

## If You Want Machine Equipment, Send Us Your Enquiries

**We have one of the largest stocks of new and used metal and woodworking machines in Canada. Many machines only very slightly used and all absolutely guaranteed. A few machines from our Toronto stock at exceptionally attractive prices are:**

**LATHES**

1—30" x 12' "Blaisdell" (used).
1—30" x 14' "Niles-Bement-Pond" (used).
1—26" x 14' "Niles-Bement-Pond" (used).
1—24" x 10' "Milwaukee" (new).
1—18" x 8' "Rae" (new).
1—16" x 6' "Reed" (used).
1—12" x 8' "LeBlond" Tool Room (used).
1—8" "Rivett" Cabinet Type, full attachments (used).
1—7" "Cataract" Precision (new).

**GAP LATHES**

1—38" x 54" x 12' Bertram (used).
1—22" x 40" x 16' McDougall (used).
1—21" x 30" x 7' South Bend (used).
1—20" x 38" x 12' C.M.C. (used).

**TURRET LATHES**

No. 4 Millhollands, capacity 1⅝" (used).
Several Davis Turrets and other makes. Various capacities.

**SHAPERS**

1—16" "MacKenzie" B.G. Crank Shaper, (new).
1—16" "Rae" B.G. Crank Shaper (slightly used).
1—24" "McGregor-Gurley" B.G. Crank Shaper (used).

**PLANERS**

1—42" x 42" x 20' Putnam, 1 head (used).
1—30" x 30" x 10' Pond, 1 head (used).
1—24" x 24" x 6' Powell, 1 head (new).

**MILLING MACHINES**

1—Briggs High Duty Type "A" 22" Traverse (new).
1—Briggs High Duty Type "B" 42" Traverse (new).
1—Whitney Hand Miller, 18" x 6" table (used).
1—No. 3 Ford-Smith Plain (used).
1—No. 3 Ford-Smith Universal (used).
1—No. 4 Cincinnati Plain (used).

**DRILLS**

2—10" Burke Sensitive (Bench type) (new)
1—15" Barnes (used).
20" "Sibley," "Champions," "Rockwell" and "Silver" (new) and (used).
1—36" C.M.C. Heavy Duty (used).
1—3-spindle 20" Silver Gang Drill (used).
1—4-spindle W. & R. Sensitive (used).

**BORING MACHINES**

1—66" Bement-Niles Vertical, 2 heads, 24" under rail (used).
1—Universal No. 2½ Horizontal Table, 42" x 22" (used).
1—Bullard "New Era" Vertical Turret, 36", complete equipment (new).

**POWER HACK SAWS**

1—No. 10 Racine 8" x 8" Cap. (new).
1—No. 7 Watkins 9" Cap., 18" Blade (used).
1—6" x 6" Racine (used).

**AIR COMPRESSORS**

1—12" x 12" Bury, Class "L," Belt driven (used).
1—8" x 8" Sullivan, Class W.G.-3, Belt driven (used).
1—8 x 10 x 8 Bury, Steam driven (used).

**GRINDING MACHINES**

1—Landis No. 4 Universal (used).
1—Landis Plain, self-contained, 36" x 12" (used).
1—Norton Plain, No. 434 (used).
1—Fitchburg Cylindrical 8" x 36" (new).
Several Tool and Cutter Grinders (new) and (used). "Globe," "Stevens," "LeBlond" and "Cincinnati."

**MISCELLANEOUS**

2—No. 4 Jno. Hall Pipe Machines (1 used) (1 new).
1—Lennox Rotary Bevel Shear, 1" Cap. (new).
1—"High Speed" Hammer, No. 3A (used).
1—Beaudry Champion Power Hammer, No. 9 (used).
1—"Grant" Riveting Machine, No. 80A (used).
1—"Grant" Riveting Machine, No. 80B (new).
1—Arbor Press, No. 4 "Greenerd" (new).

# Special Machinery Manufacturers

We have frequent requests from manufacturers in the United States for information regarding Canadian firms who are equipped to manufacture their line.

We would like to receive, therefore, the names of any firms who might be interested in inquiries of this kind. We desire the following information:

Name of firm and full address.

Description of shop and equipment.

Particulars regarding regular line, if any.

Class of work interested in securing and best equipped to handle.

Foundry equipment or connection.

This information will be filed and other necessary particulars forwarded to American manufacturers who are likely to be interested.

## ELECTRICAL HEAT-TREATMENT

A HEAT that is not only clean and even but a heat that is exactly under control.

A HEAT that leaves the steel clean and free from scale, free from distortion and hardens every piece to the same degree of hardness.

A HEAT that will decrease the cost of your tool department from 20 to 50%.

THE HEAT produced by

# HENDEY

*This*

# 15-INCH PILLAR SHAPER

*Will End Your Search For a Thoroughly Dependable Shaper*

In designing a machine with the speed, accuracy and rigidity of this Hendey Pillar Shaper, special attention was required to avoid complicated construction.

The simplicity and handiness of all adjustments are great advantages in securing economical volume production—features well worth considering.

One of these days you'll be searching for a thoroughly dependable pillar shape. Bear this Hendey in mind when that time comes—it will end your search.

# 20"x8" Engine Lathe

## with quick change gears

is of the latest design and equipped with the up-to-date features of Lathe construction. It is fully equal in every respect, if not superior, to any Lathe of domestic or foreign build on the market to-day.

The quick change gear mechanism is simple and effective. It enables the operator to cut practically all threads in every-day use without calculation or removal of gears.

The spindle and bearings are considerably larger than are usually supplied on a Lathe of this size. The spindle has a 1¼" hole bored from the solid through its entire length.

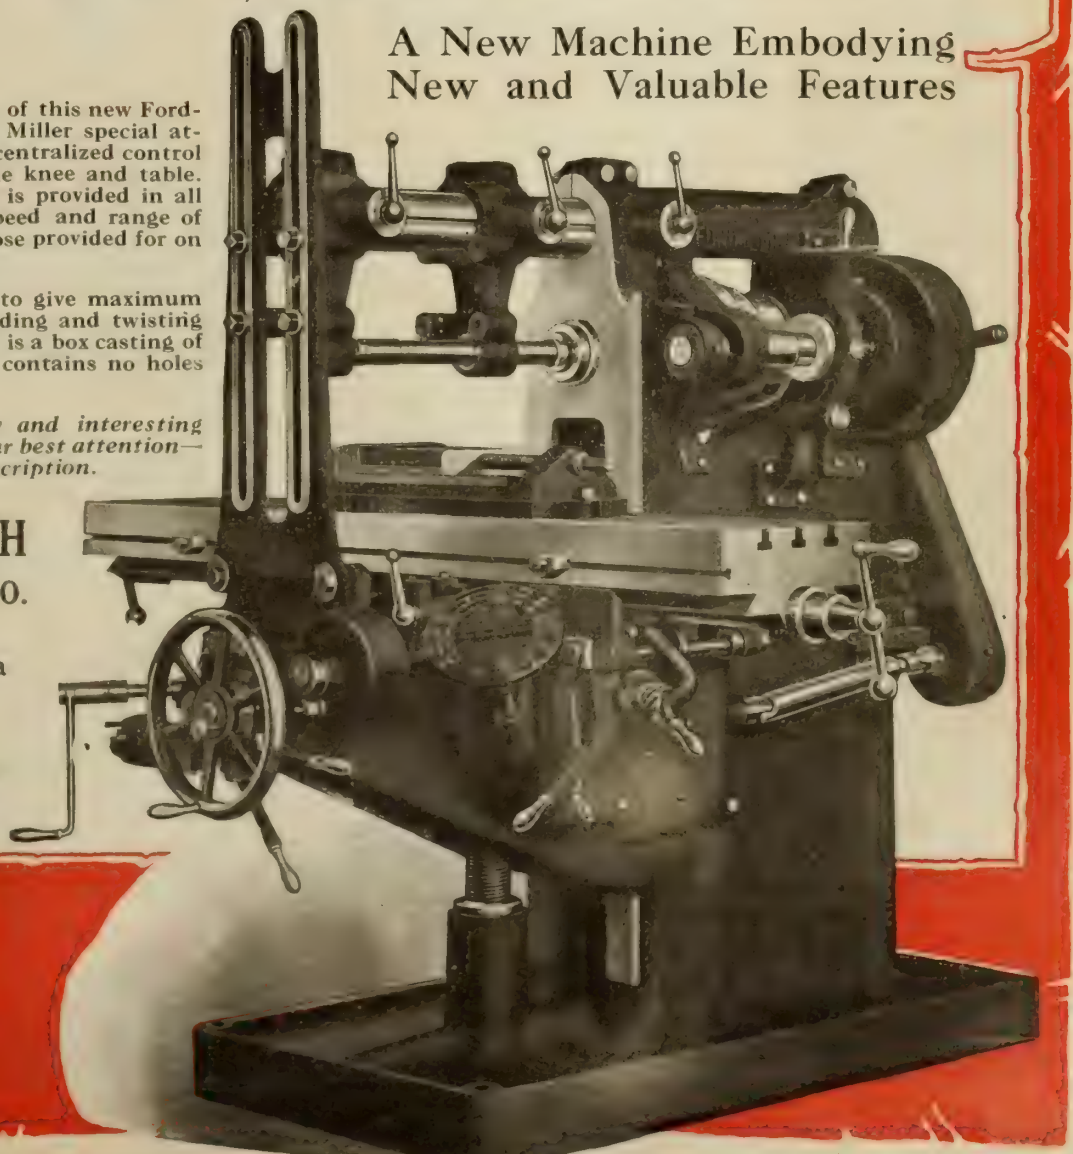
FORD-SMITH



NO. 4 PLAIN MILLER

A New Machine Embodying New and Valuable Features

IN the construction of this new Ford-Smith No. 4 Plain Miller special attention is given to centralized control of all movements of the knee and table. Rapid power traverse is provided in all directions and the speed and range of coarse feeds equal those provided for on geared millers.

The knee is designed to give maximum rigidity under the bending and twisting stress of the cutter; it is a box casting of the solid top type and contains no holes at the top or sides.

*There are other new and interesting features worthy of your best attention—write for complete description.*

## All the Fine Qualities That Good Work Demands

Pratt & Whitney Small Tools enjoy an enviable reputation for excellence that has been well earned in the high production shops of the country. Where stamina as well as exceptional accuracy and precision are required P & W Tools have more than held their own. Our line is complete. It includes taps, dies, milling cutters, reamers, punches, drills, etc., both of standard and special design and in sizes to suit every requirement.

Prompt service is assured at our nearest store, where P & W Small Tools are carried in stock for immediate delivery.

# Clean Metal Surfaces Pay Big Dividends-

Aluminum crank cases made a ticklish cleaning job until Oakite arrived on the scene. The flaky appearance that resulted when an alkali cleaner was used, was at once eliminated and reports show better, quicker cleaning at lower cost.

No trouble to clean these large truck chassis parts. Illustration shows tank filled with Oakite cleaning solution and two or three dips made the metal surfaces chemically clean.

Another of the many motor car plants that find it economical to use Oakite materials for cleaning metal parts. Here is shown the Oakite tank wherein oil and grease is removed from cylinder blocks.

Above: The removal of tempering and quenching oils is a man size job. This plant gets 100 per cent. clean surface by using Oakite for removing long standing oil from heat treated taper rolls. Two or three plunges of basket in tank filled with Oakite solution—and the job's done.

Below: Cleaning and electroplating the base metal in one operation is a favorite stunt in plating shops that use Oakite Platers' Cleaner. This plating department secured 100 per cent. perfect plating results on automobile parts.

Here's a cleaning trick employed by an axle maker. The parts are washed in tank containing Oakite materials—then instead of the usual rinse—the parts are stored away for further use—and the protecting film left on the parts prevents rust.

# The New Canadian-Detroit Double-D Rolled Drill

***Made in Canada***

PRODUCTION requirements in an ever-increasing number of plants necessitate the use of a strong, accurate drill, specially designed for hard drop forgings, steel castings, and other alloy steels equally tough and difficult to drill.

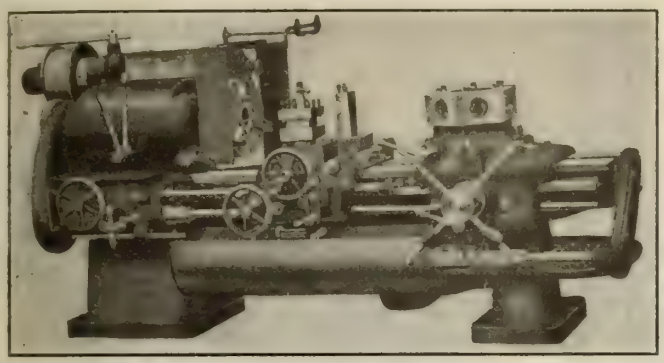
For this service we have developed a hot rolled process drill known as the Canadian-Detroit Double-D (DD) Rolled Drill. It combines the strength of the forged type drill with the accuracy and uniformity of the milled type.

The flute of the DD is formed straight from the bar stock by successive passes through specially built and patented rolls at a temperature of 1850° F. This mechanical rolling of the flutes produces a refinement and uniformity in the grain of the steel and gives additional density at the centre and at the outer edge. Each drill is rolled separately, and the rolls are so designed and operated as to produce the same uniform increase in web thickness as is obtained in high-grade drills of the milled type.

The fluted drill is reheated and twisted in a specially designed automatic machine. The twisting process is held absolutely uniform, giving the same increase in helix angle from shank to point, 27° to 32°. This standard has been adopted on our milled drills and has been proven by exhaustive experiments to be the most efficient.

The DD has increased production and cut drilling costs in many of the finest plants in Canada. A fair test will convince you.

Manufactured and carried in stock at Walkerville in all sizes from ½ inch to 1½ inches.



We also manufacture and carry in stock all sizes and types of high speed and carbon milled drills.

# Compressed Air

**The Modern Industrial Force will help keep your Output Up and your Overhead Down**

**Class EL-1 Single Stage, Power Driven Air Compressor. Built in a wide range of sizes and capacities and shipped from stock. Illustrated and described in Bulletin K-300-C.**

Many Industrial Executives are confronted with the problem of greater production—more rigid economy—the conservation of energy and full value for time and money spent.

One force that comes close to solving this problem is compressed air. In nearly every field of industrial activity, almost without limitation, this giant power is saving time and labor. Through its use "lost motion" is reduced and the productive time of men and machines increased and conserved to a remarkable degree—often in fact to a point where one man using pneumatic equipment will do as much as five or six men working by hand alone.

Foremost on the list of reliable equipment which will enable you to make the most efficient use of this force are Canadian Ingersoll-Rand Steam and Power-driven Air Compressors, Direct Lift Air Hoists, Little David Riveters, Chippers, Caulking Hammers, Drills, Wood Borers, Grinders, Sand Rammer Blow Guns, Stationary Air Motors, Motor Driven Air Hoists, etc. Write for bulletins on any or all of these products as the number of ways in which air operated equipment will prove a source of economy and a spur to production in your plant can best be determined by a study of our catalogues followed by a consultation with our nearest sales and service branch.

# AMERICAN STEEL SPLIT PULLEYS

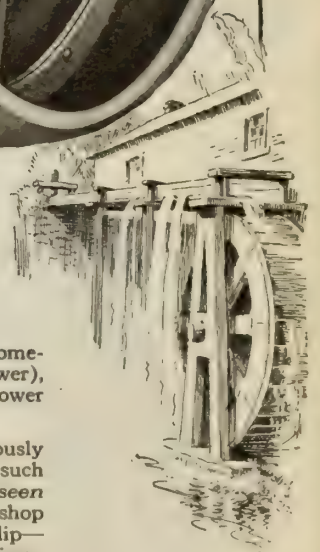

***Figure the Cost of Pulleys in Terms of Saved Power***

THE old sluiceway sometimes leaked water-(power), but who cared? That power was cheap—yet

Today, with tremendously expensive power costs, just such wastes are occurring *unseen* in the average machine shop through excessive belt slip—excessive friction in bearings, dead weight of pulleys that consume power.

How to overcome these troubles is explained in our book, "Getting Maximum Pulley Efficiency."

**The American Pulley Company**
Philadelphia, Pa.

The AMERICAN PULLEY

A wheel with a broad rim—transmitting power from or imparting power to machinery or changing the direction of motion by means of a flat belt.

# THE JOHNSON FRICTION CLUTCH

## The Case Against the Countershaft

The old familiar countershaft drive, through cross belts and tight and loose pulleys, stands accused of the following offences against efficiency.

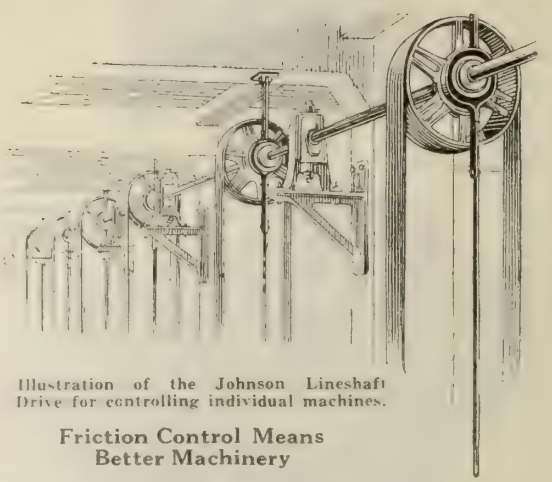
In that it—

1. Involves needless equipment.
2. Costs too much to set up.
3. Prevents economical and systematic use of space.
4. Operates sluggishly.
5. Multiplies belt troubles and the resultant cost of upkeep.

Modern practice has discarded the antiquated countershaft for the simplicity and efficiency of the clutch drive direct from lineshaft.

**Adopt the Johnson Lineshaft Drive**

The economical, efficient and durable method of power transmission through friction control.



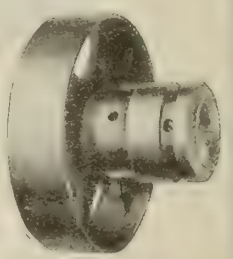


Illustration of the Johnson Lineshaft Drive for controlling individual machines.

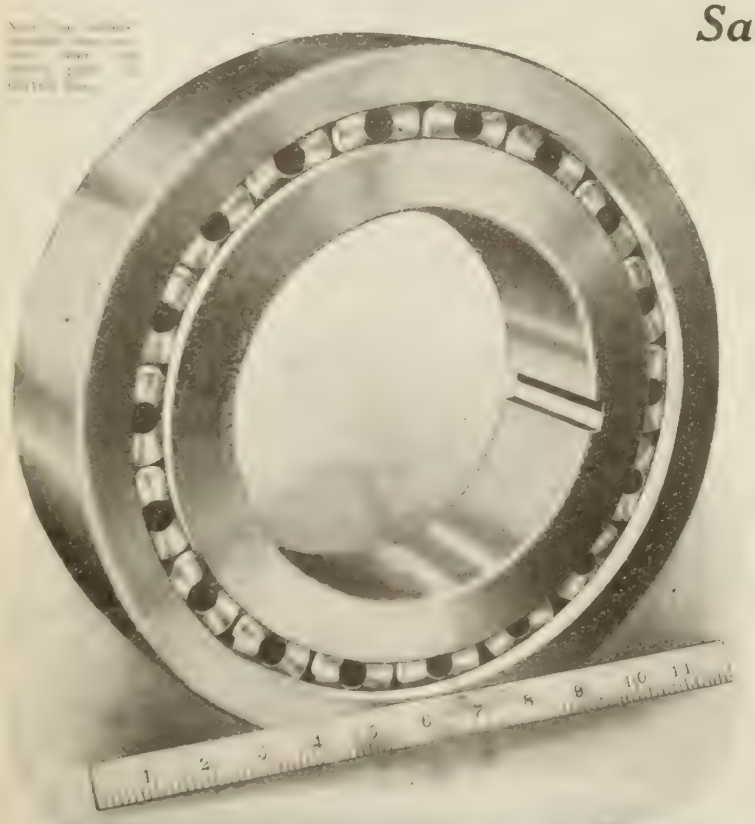
**Friction Control Means Better Machinery**



Whether it is applied overhead or in the machine itself.

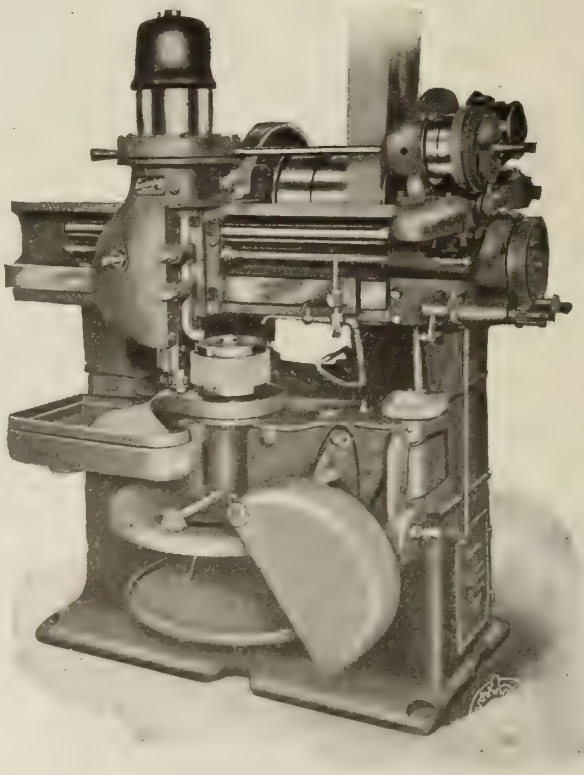
# Gear Cutting With the "IFS" Left Out

## The Gear Shaper Way

A production manufacturer knows that he will secure good gears IF he has an accurate cutter, an accurate machine and a machine working on the correct principle. The whole question of good gears is resolved in this one little word "IF."



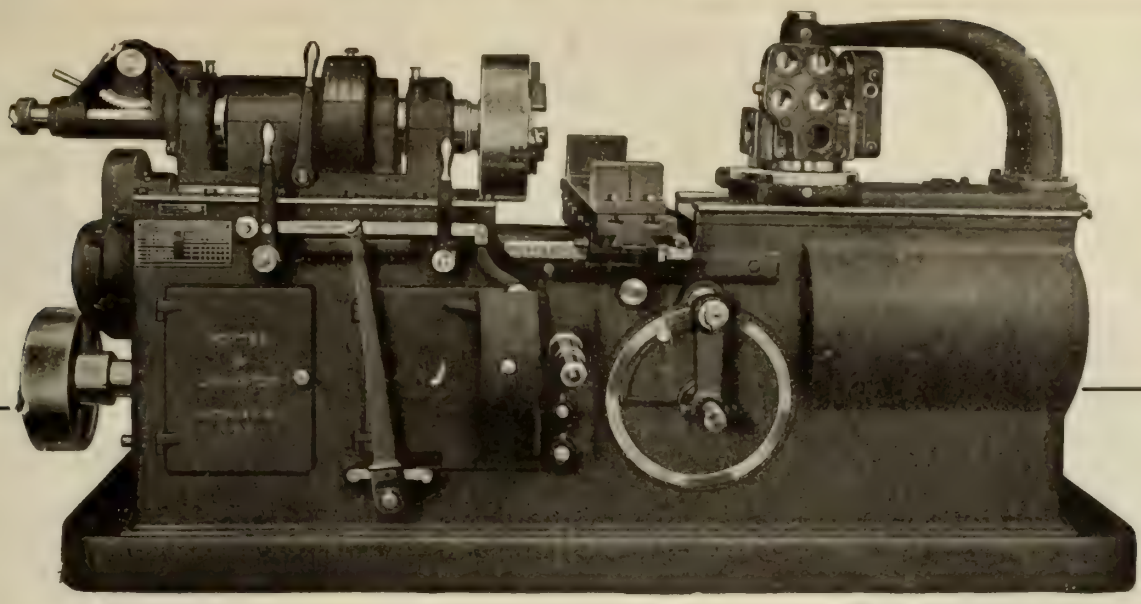
When the Gear Shaper was originally designed, the question of "IF" was taken into consideration and every possible means known to mechanical engineering was employed to eliminate the "IFS" from gear cutting.

That we have been successful in solving the problem is evidenced by the fact that each ensuing year sees a larger number of manufacturers adopting the Gear Shaper method.

How the Gear Shaper has accomplished this is clearly explained in our general catalog "Commercial Gear Cutting," which is a treatise on the subject of:—

Gear Cutting with the "IFS" Left Out.

**Send for your copy to-day.**



The Fellows Gear Shaper—the machine which has taken the "IFS" out of gear cutting.

# Monel metal measures power plant efficiency

DEVICES depended upon to detect and "show up" inefficient power plant operation can do their work no better than each metal part in them.

Coal, hot flue gases, steaming boiler feed water, high pressure and superheated steam, all act to wear out the device used to measure, handle or control them.

Metals commonly used for contact parts in these devices yield to corrosion—rust out. Of the commercial metals, only Monel combines the strength of steel with the ability to stand up under the attacks of most acids and alkalies and of high heats and high speed vapor erosion. Therefore, vital parts of automatic coal-weighing scales, $CO_2$ Recorders, Venturi meters, flow meters, hot water meters, gauges, etc., are made of Monel.

In addition to the few uses for Monel listed above, leading designers specify Monel. Monel is now used in many places where other metals have been tried and have failed. For instance, Chapman, Crane, Jenkins, Lunkenheimer, Nelson, Pratt & Cady use Monel for valve stems, seats, rings, clappers, spindles, etc. It has a prominent place in the specifications of the largest engineering organizations in the country.

# Small Machine Shops, Auto Repair Shops Welding Companies

## *Do you want a business like this?*

A day's work laid out at the repair shop of Geo. H. Woodwards, San Francisco

### Opportune Time

There is no business to-day that has the possibilities and which fits so nicely into a small machine shop, automobile repair shop, or a concern doing welding, as the regrinding of worn or scored cylinders.

Many companies would have had to close their doors this Spring but for the business obtained through regrinding. It does not require skilled mechanics for operators, and the profit received on the capital invested is unusually large.

### The Field for Regrinding

There were over 9,000,000 commercial and pleasure cars registered during last year. Truck and tractor cylinders require attention once a year. Passenger cars should be looked over at least once every two or three years. Figure out for yourself what your chances are with only approximately 350 concerns properly equipped for such work. Consider also the fact that three 4-cylinder blocks a day will bring profitable returns.

### Advantages to the Automobile Owner

Reground cylinders fitted with new pistons and rings will give the motor as much, if not more, power and pep than when it was new. It cuts the oil and gas consumption in two and stops all excessive smoking.

### Necessary Equipment

Eighty-four per cent. of all pleasure cars, and ninety-one per cent. of all commercial motors manufactured are ground, and Heald Machines are used exclusively. The Style No. 55 is built expressly for regrinding work. It is simple, moderately priced, self-contained, and has a very large capacity and range, easily taking care of singles, doubles, four and six en bloc cylinders.

In addition, to handle the work satisfactorily, one should have a small lathe and drill press, bench and hand tools. A small external grinder would be convenient for finishing pistons, thus enabling the shop to purchase semi-finished pistons and grind them to the oversize required.

**Now is the logical time to get started. If you want figures, in addition to the above facts, write, wire or 'phone**

## The Heald Machine Company

# This is what Larcul did for us:

*"On a Gould & Eberhardt, also B. & L. Milling Machines. Milling Cutter 6" diameter, 28-tooth, 8" wide. Stock 60 degrees carbon, 16% tungsten. Cutter speed 157 feet per minute. Milling cut across cutter 8", time—8 minutes. Finish glass smooth and sharp. Needless to say, we are very much pleased with results."*

This is only one of the many letters we receive from enthusiastic users of

## LARCUL CUTTING OILS

Your production line takes a big upward sweep when you start to use LARCUL. More individual pieces can be turned out in a day, because your machines run faster, without overheating the tools. As LARCUL positively carries off the heat, tools hold their cutting edge longer and hence do not require frequent re-sharpening, with its consequent delays—another saving in time that helps to boost production.

LARCUL AMBER, a transparent cutting oil for high carbon, vanadium, chrome nickel and tungsten steel; and LARCUL EBONY for open hearth, low and high carbon steel.

*A demonstration entails no obligation. Write us about your cutting problems—To-day!*

Franklin Die-Castings for Domestic Devices

## Making Housework Easier

HOUSEWORK no longer represents the drudgery of the past. The revolutionizing of every field of labor has affected the home as well as the factory.

The Die-Casting Process has done its share in developing many domestic devices unheard of 50 years ago—such as vacuum cleaners, coffee percolators, and washing machines. These appliances have aided the housewife in her daily tasks, shortened her hours, lightened her duties, and added to her comforts.

In 1892 we originated the Die-Casting Process, and for nearly thirty years we have been reducing costs and simplifying production in many fields of industry. The addition of the Standard No. 12 Aluminum to the Tin, Lead, and Zinc base alloys already in use has enabled us to meet a still wider range of individual needs.

*We quote from samples or blueprints. Write for booklet, "Franklin Die-Castings in Many Fields."*

# MORTON

# Increased Driving Box Repairs Forced the Purchase of this Morton Draw Cut Shaper

Delays to output were traced direct to driving box repairs in this busy shop. Time element and shortage of man power were considered and the installation of this "Morton" reflects the good judgment of these thoughtful officials to install machines of guaranteed production power.

This Morton handles all the machine work on driving boxes—planing to thickness, planing shoe and wedge faces and crowning for bearing brass. It simplifies handling and reduces machine time.

May we send Bulletin A-6 explaining numerous points of merit?

# Putting Backbone into Hand Tools

*Bulletin N-21 shows how*

# Heat Treating Containers of

# Cast Nichrome

ENDURE IN HIGH TEMPERATURE

ENDOWING hand tools with stamina equal to the daily use and abuse they get calls for more than haphazard methods of hardening, tempering, annealing, carbonizing, etc.

Manufacturers who have attained the highest average of uniformity in quality, and whose wastage is down to the lowest point, know the value of containers, racks, muffles, retorts, etc., that give uniform service.

This is one reason why the use of Cast Nichrome is constantly increasing. The longer life of Cast Nichrome (guaranteed for thousands of hours at 1800° F.), the shorter heats and lower fuel consumption further contribute to an economy that no man who is responsible for results can resist. Shall we show you some results—and Cast Nichrome Service records?

# Is Merchandise Properly *SOLD* To You?

YOU recognize the direct connection between production methods and the cost and quality of the goods; you have a right to know that goods are properly made. Yet the manufacturing, important though it is, is but the first lap on the journey to the consumer. Merchandise must be sold; sales cost is just as legitimate as manufacturing cost, and it has *just as direct a bearing upon the final cost to you.* If needless expense is incurred, it means either higher prices or a decrease in quality or service.

Obviously it will pay you to recognize efficient selling service. With this simple truth clearly in mind, permit us to enunciate an established, proven sales principle—

**—The seller who advertises in the Business Papers, reaching *only* the class interested in his message, is using the most direct and economical method of helping you maintain an intelligent contact with your sources of supply.**

This kind of advertising bears the same relation to the sales department that an improved machine does to the production department. And if the sales methods are wasteless and efficient, you seldom need worry about the goods. Each acts as a support and stimulus for the other.

On the other hand, the practice of buying circulation by the million in the hope of influencing a few thousand possible customers, is open to question. The best machine is a source of waste when improperly used, and this is no reflection on the machine. Concentration beats scatteration, and costs less. The right tool in the right place is a principle of as much importance to selling as to production.

There are many other reasons why discriminating buyers are giving preferred consideration to the concerns which tell them their business story in the buyer's own business paper, *especially* if that paper has subscribed to the high standards of practice of The Associated Business Papers, Inc.

# The "Lehmann" Improved Selective Head Lathes

**(Patents Pending)**

**SIZES—14" to 24" SWING**

On account of its simplicity of construction, great driving power and rigidity, ample range of speeds, moderate tooth travel of its gears, compact and shapely appearance, the "LEHMANN" Selective Head Engine Lathe stands to-day in a class *ahead* and *alone*. Some of the features of construction are:

Sixteen Spindle Speeds in correct geometrical progression obtained with the use of only ten gears.

Improved Friction Clutches (Patents Pending) running in oil, requiring no adjustment and giving forward and reverse control to spindle.

Heat-treated or Hardened Steel gears.

All Shafts, except spindle, running on ball bearings.

Spindle of alloy steel, hardened and ground at the bearings and running in phosphor bronze boxes.

Head Casting forms oil-tight case enclosing all running parts.

In addition these lathes embody all features such as the patent quick change mechanism, the tailstock spindle locking device, the rod and screw shift, etc., forming part of the "LEHMANN" Cone Head Lathes which have acquired an enviable reputation for accuracy and production.

***Let us describe more fully this Exceptional Lathe and its Distinctive Advantages***

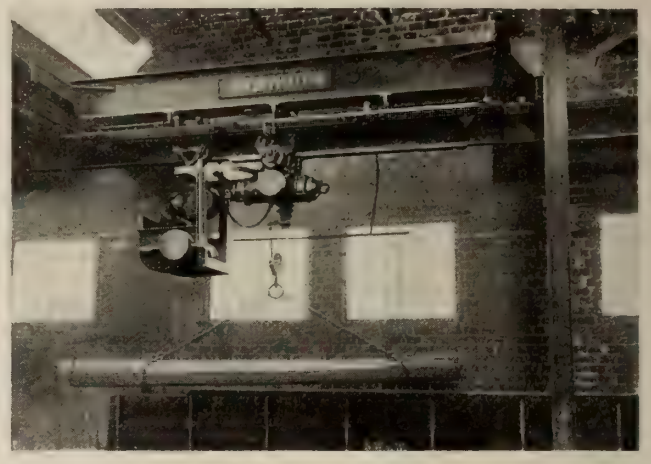
## LEARNED From EXPERIENCE

WHEN *ARMSTRONG* earned his living by RUNNING A LATHE he often wished he could get a set of Lathe Dogs which would stand up to the work. The Screws especially were a constant source of trouble, points upsetting and threads stripping.



His practical experience is the basis upon which the *Armstrong* line of Dogs and Clamps is built. The bodies are Drop Forged of a special grade of steel selected for its high degree of stiffness and great tensile strength. Screws can't be beat for long lasting qualities; they are made of Chrome-Nickel Steel, given a special heat treatment, and the points are hardened.

# ALLIGATOR

TRADE-MARK REG. U.S. PAT. OFFICE

## STEEL BELT LACING

## How the "ALLIGATOR" Line Builds Business for Jobber and Dealer

Read these features on which ALLIGATOR Steel Belt Lacing will increase your sales to users of power and conveyor belting.

ALLIGATOR Steel Belt Lacing is easy to apply. Requires no tool but a hammer and only three minutes average time. Anyone can put it on.

Makes a permanent hinged joint **that can be run on both sides,** and works equally well on **any** size or kind of belting from tape to 5/8-inch thickness.

The staggered teeth (see illustration) penetrate lengthwise through the belt and clinch on to the sides leaving burden carrying fibres intact. The sectional rocker hinge pin is serviceable under all conditions.

Everywhere in all industries where belting is used, ALLIGATOR is chosen because of its superiority over other types. The decision of hundreds of thousands of belting users influence you to stock it. ALLIGATOR, the best lacing proposition for the trade.

Besides these reasons: Quick application, belt saving powers, economy and general satisfaction—ALLIGATOR Steel Belt Lacing is being brought to the attention of master mechanics, shop superintendents, purchasing agents, etc., in a large list of national and local publications devoted to various commercial and industrial pursuits.

# One Man at the Air Drill

IN the boiler shop of the Canadian plant of a great American industry the men said no staybolt tap made could be driven easily enough to require but one man at the air drill —said they'd strike before they'd obey the order to use only one man on each staybolt tap.

But the answer came back from headquarters in "The States" that the *"Maxi"* Staybolt Tap made by the GTD Corporation was different; that only one man was needed and that only one man must be used in Canada.

Headquarters even sent photographs to prove their statement but they thought the photos must be fakes, and so the Railroad Union sent a committee to see it done—and they saw and were convinced.

This is one of the best arguments we can give you on the *"Maxi"* Staybolt Tap. The saving in labor is not the only argument that there is, however.

The *"Maxi"* Staybolt Tap has the *exclusive* features of a *pilot point*, which finds the hole in the inner plate immediately, and guides the tap into it—a *chip breaker*, which prevents accumulation and wedging of chips —an extra long taper threaded section—specially designed flutes.

Consequently the *"Maxi"* cuts many more threads than any other staybolt tap on the market.

*Let us tell you more about this remarkable tool. Clip the coupon and send it in. No obligation, of course.*

# Cleco Pressure-Seated Air Valves

## Bowes Air Hose Couplings—Cleco Never Slip Hose Clamps and Cleco Grooved Hose Nipples and Hose Clamp Tool

**STYLE O.F.** is an Outside Thread Female Pipe End. Made in sizes ⅜-inch to 1½-inch.

**STYLE I.F.** is an Inside Thread Female Pipe End. Made in sizes ¼-inch to 1½-inch.

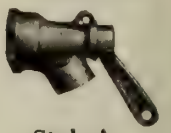
**STYLE H.F.** is a Female Hose End with spiral shank to insert into the hose and has groove for the Never Slip Hose Clamp. Made in sizes ¼-inch to 1½-inch.

**STYLE H.M.** is a Male Hose End with spiral shank to insert into the hose and has groove for the Never Slip Hose Clamp. Made in sizes ¼-inch to 1½-inch.

**STYLE O.M.** is an Inside Thread Male Pipe End. Made in sizes ¼-inch to 1½-inch.

**STYLE I.M.** is an Inside Thread Male Pipe End. Made in sizes ⅜-inch to 1½-inch.

The Male and Female Ends of Bowes Couplings interchange in sizes ¼-inch to ¾-inch. Sizes 1-inch and 1¼-inch interchange. The 1½-inch ends interchange only with themselves.



### BOWES COUPLINGS

Are instantly connected or disconnected.
They are absolutely air-tight under all pressures.
They quickly pay for themselves by stopping costly leaks.
They interchange in sizes most commonly used.
They have no loose parts to be mislaid or lost.
They are made of brass and will not rust.
The U-shaped Gasket interchanges in couplings ¼-inch to ¾-inch.

### CLECO VALVES

Style P.O.

Style M.O.

Style A.

Style P.O.—Made in sizes ¼ in., ⅜ in., ½ in., ¾ in., 1 in., 1¼ in., 1½ in., 1¾ in., and 2 in. Pipe Outlets. Inlets are one pipe size larger.
Style A—30° Angle Valves, are made in sizes ½ in., and ¾ in.
Style M.O. Valve—Has 1 in. Inlet and Bowes Coupling Outlet, Connects with Bowes sizes ¼ in. to ¾ in.

### CLECO GROOVED HOSE NIPPLES

Grooved Nipples when attached to the Hose with Wire Clamps as illustrated cannot "blow out." Wire clamp tool shown below applies the wires to hose.

**The Lightening Hose Clamp Tool** illustrated applies wire clamps at a cost of 1½ cents each.

**In stock:** Riveting and Chipping Hammers, Air Drills, Emery Grinders, Sand Rammers, etc.

**Use Annealed Wire No. 14**

**IMPORTANT:—The Small Leaks in your "AIR LINE" mean serious loss in DOLLARS. Have you any idea of the amount of "Air" wasted in small leaks at your connections? Air Leakage through 1-16 in. opening equals 5.32 cu. ft. per minute at 80 lbs. It will pay you to install Bowes Couplings and Cleco Valves, which will stop costly leaks.**

**Bulletins Nos. 43, 44, 46 and 48 mailed on request.**

**THE MODEL HOSE LINE** illustrated shows correct styles of couplings and valve to use and proper way to attach the Cleco Never Slip Hose Clamps to Bowes Couplings. No "blow-offs" can occur when "Cleco" Clamps are used.

*New Truths and Old Fallacies*

# Hardness of Alloys—*Continued*

We have referred several times to the compression test of alloys made by the American Society for Testing Materials, and we give the figures below:

| No. | Copper | Tin | Antimony | Lead | Deformation of Cylinder 1¼" dia. x 2½" high at 70° Fahr. At 1,000 lbs. per in² | At 5,000 lbs. per in² |
|---|---|---|---|---|---|---|
| 1 | 3 | 96 | 1 | — | 0.0000 | 0.0010 |
| 2 | 3 | 80 | 17 | — | 0.0000 | 0.0015 |
| 3 | 3 | 81 | 16 | — | 0.0010 | 0.0045 |
| 4 | — | 75 | 12 | 10 | 0.0005 | 0.0025 |
| 5 | 2 | 63 | 15 | 18 | 0.0010 | 0.0030 |
| 6 | 3½ | 20 | 36 | 40½ | 0.0015 | 0.0050 |
| 7 | — | 4 | 1 | 75 | 0.0010 | 0.0050 |
| 8 | — | 2 | 1 | 80 | 0.0020 | 0.0090 |
| 9 | — | 1 | 6 | 85 | 0.0040 | 0.0120 |
| 10 | — | 1 | 7 | 85 | 0.0010 | 0.0100 |
| 11 | — | — | 4 | 87 | 0.0010 | 0.0100 |
| 12 | — | — | 4 | 90 | 0.0025 | 0.0170 |

In analyzing these figures it should be remembered that metals have no ultimate crushing strength, as they spread when the load goes beyond a certain point; also that tin base metals are more resilient than lead base metals and that the former will resume their original form, partially or altogether, when the pressure is removed, whereas a lead base metal will become permanently set under a comparatively light load, and the value of the above figures are somewhat dependent upon whether measurements were made before or after the load was removed. This thought was suggested by the apparently anomalous difference shown between formulas Nos. 1, 2, and 3. If formulas 1 and 2 did not resume their original form under the 1,000 lbs. pressure and partially resume it under 5,000 lbs., then all preconceived ideas are upset as to the value of copper as a hardener, as shown by comparison with the No. 3 formula, which contains a greater quantity of both copper and antimony.

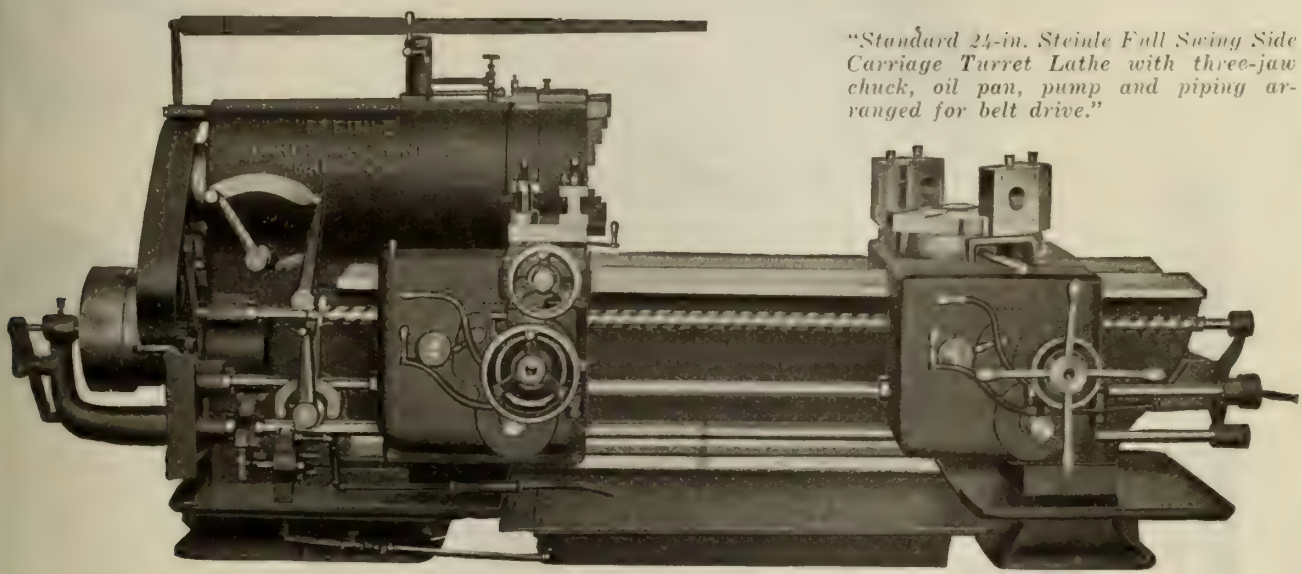
## Satisfactory for both Roughing and Finishing on this Centerless Grinding Operation

The photographs show the grinding of steel wrist pins at the Houpert Machine Company, Long Island City, New York.

The machine is a Sanford Centerless Grinder equipped with two Waltham Grinding Wheels. One 120—2½ Alowalt, 20″ in diameter, 3″ thick, grinds the parts, the other of the same grade and thickness but only 10″ in diameter and working at a much lower speed feeds the pins to the grinding wheel.

The pins are .678″ in diameter by 2⅞″ long, with about .020″ left on the diameter for finishing. About .004″ of this surplus is removed each time the pin is passed between the wheels—about three or four times or until the diameter is within .003″ of the finished size. The wheels are then dressed and adjusted and the pins are finished to a limit of .0003″. Production averages 50 completely finished pins per hour—and the foreman gives much of the credit to Waltham Wheels.



*If you have a unique or difficult grinding job try a Waltham Grinding Wheel. There's one for every class of work and the right one is bound to be satisfactory.*

# KEMPSMITH

## No. 2 UNIVERSAL

Thirty-two years ago the Kempsmith Company began its career in a small one-storey frame building. To-day there are four main buildings, aggregating 106,000 square feet of floor area, besides various storage sheds, etc. Every building of the plant is a model of its kind.

It has always been, and will continue to be, the purpose of the Kempsmith Company to produce machines of the highest quality only, suited to the most advanced practice.

Every machine, whatever size or type, is put to test under cuts and conditions purposely more severe than it will encounter in even the most progressive shops, and when it leaves our factory it has our positive and definite guarantee back of it.

***Literature will be gladly sent upon request.***

# HOEFER

## A driller service worth consulting

The value of any service depends on two things: the practical knowledge behind it and the spirit in which it is offered.

Hoefer Driller Service is worth consulting because of its helpfulness judged by **both** standards.

The practical knowledge behind Hoefer Service embodies a driller-manufacturing experience of over 25 years. But it includes more than that. Every Hoefer Salesman is first of all a shop man. He learned his subject in a shop, he used drillers long before he started to sell them, and he is capable of giving you suggestions of real value, based both on his own experience and that of the many up-to-date shops using Hoefer Drillers.

The spirit behind Hoefer Service is best indicated by its constant readiness at your call, irrespective of whether or not the sale of a Hoefer Driller is involved. A request for information or suggestions involves no obligation whatever on your part and is always promptly and courteously as well as competently attended to.

Try out Hoefer Service on your present or proposed drilling operations—it may point the way to unexpected possibilities for saving.

# Norton Alundum Grinding Wheels for Economy

*When you are grinding on production work it is essential that you obtain the best wheel for each particular job.*

*The price of the wheel is only one element in the matter.*

**The factors that govern the costs on production work are:—**

Pieces Ground or Weight of material removed — Per Hour

Pieces Ground or Weight of material removed — Per Wheel

Labor Cost

Overhead Cost

When these figures are obtained and compared you will find that you can use Norton Alundum grinding wheels to advantage.

You can expect the same results on wheels for general shop work even though such figures are not available.

We are ready to help you in any way possible, and if you will advise us the job you are doing—we will recommend both wheels and methods.

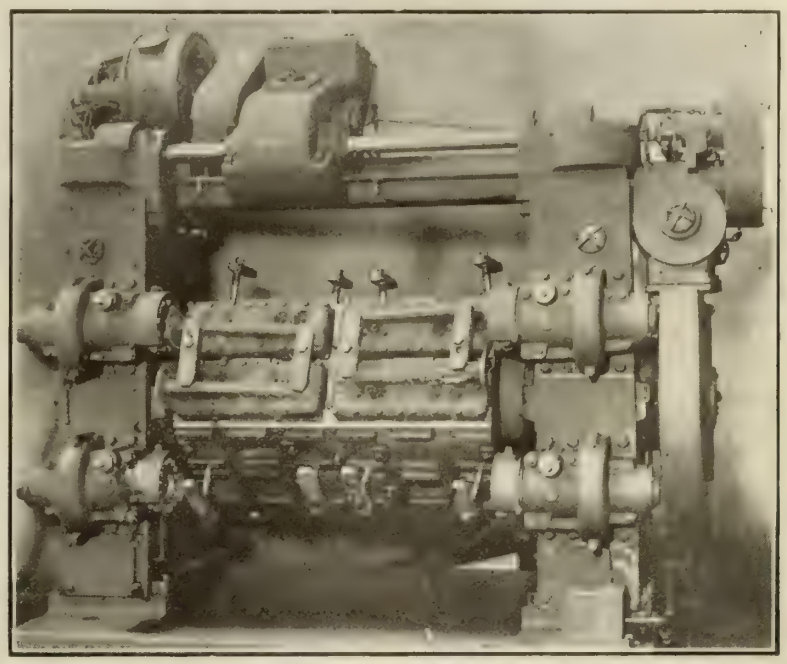
CANADIAN MACHINERY
AND
MANUFACTURING NEWS

VOL. XXV. No. 14. April 7, 1921

# Continuous Milling

Uses of Drum—Rotary and reciprocating types of continuous millers. Milling end, top, and bottom of automobile parts.

*By J. H. Moore*



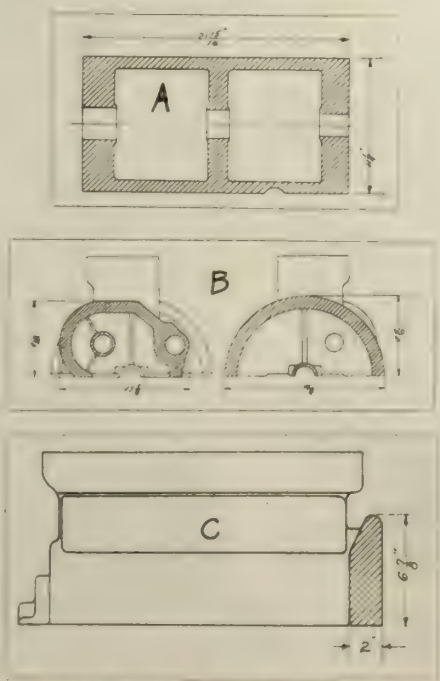


FIG. 4.—MILLING END OF CYLINDER HEAD FOR TRACTOR MOTOR

"A MACHINE that, while holding the work, operates upon it with a revolving cutter or mill may be termed a milling machine." These words are taken from a rather old text book simply to illustrate the fact that milling machines have developed wonderfully within the past few years, and while the above words still convey the principle of milling, they are rather weak in applying to the modern miller.

Walk through an up-to-date manufacturing plant today and what do we find? Batteries of milling machines, large, medium and small, each type of miller being especially adapted to certain classes of work, and where conditions permit continuous millers are used which practically eliminate the human element. All this has taken time. The first miller produced was very rough in character, yet had the correct principle behind it. Since that time improvement upon improvement has taken place, until at the present time we have work being performed on millers that was unthought of a few years ago.

The automotive industry has been largely responsible for this development, as their problem soon became one of quantity production, plus interchangeability. The various automobile concerns soon realized that if they were to be successful in producing cars at a minimum price, they must have ideal production facilities. This of course led machine tool designers away from the beaten path, special machines being the ultimate result. The value of a machine specially equipped to produce a standard product in quantity soon become apparent, and today it is a common occurrence to order a machine to produce some certain part. In other words, the machine is built around the piece, and specially adapted to the design of the part to be produced. True, this may only mean a standard machine with certain attachments or changes in design, but in many cases it means a brand new development.

EXAMPLES OF WORK PERFORMED.

### Continuous Millers

One of the machine tools that has received a great deal of attention lately is that of millers, especially the continuous type. As the name implies such machines make possible the performing of duplicate operations without loss of time for loading or unloading of fixtures.

Through the courtesy of the Ingersoll Milling Machine Co., Rockford, Ill., we are able to illustrate in the present article certain types of continuous millers that have been produced by them for various purposes. With each photograph we will embody definite data regarding the machine and the product being manufactured, so that, in a way, the article will be a lesson on continuous milling practice.

It is of course easily understood that

milling machines of the continuous type do not always offer decided advantages over the more conventional styles used in the average plant. Each has its proper place, but there are unquestionably operations in large production plants where continuous milling can be adopted at considerable saving. However, let us leave this phase of the question for the present and consider one type of machine as used in continuous milling.

### The Drum Type

Referring to Fig. 1, we see a drum type continuous milling machine that was built to mill the ends of a heavy duty tractor motor at the rate of 30 per hour. The large drum is mounted on a heavy axle and is driven from each side by huge worm wheels. It will be noted that the drum is six-sided, and that each side is fitted with a fixture to hold one casting.

The principle of such machines is briefly this: The drum, which in reality is the table, holds the castings and revolves past the spindle heads which are mounted on the housings at each side. In the machine shown at Fig. 1 there are two sets of heads, the upper heads carrying roughing cutters, and the lower ones finishing cutters. The operator stands at the rear of the machine, and as the drum revolves up past him, he removes the finished work and replaces the same with rough castings. The operation of the machine is continuous as the operator merely loads and unloads the fixture. The rate of feed is fixed, also the spacing of the fixtures, this determining the interval between cuts. In other words, maximum production has been carefully planned and the operator has no control over this factor.

It is easily understood that such a machine must be extremely heavy and rigid. The work is at a considerable distance from the axis of the drum and must be supported rigidly in order that an accurate, heavy cut can be taken. For this reason these machines are very rugged in design and the one illustrated at Fig. 1 weighs approximately 40,000 pounds.

By studying the photograph it will be seen that the heads may be adjusted vertically on the housings if so desired. Each head is also fitted with a special quill so that the cutter can be adjusted in or out as required. The drum itself is so arranged that it can be removed from the axle and replaced with another drum to accommodate different work, should such a change be necessary. As a general rule, however, this is seldom done, for, after all, such a machine as shown is a single purpose tool, and is not used except where there is enough work on some standard operation to warrant its installation. An outline drawing of the surface being milled is shown at A in Fig. 2, and a finished casting is produced every two minutes.

The drum travels at the rate of one revolution every twelve minutes, and it revolves continuously. In the case of the machine shown, the castings are brought to, and away from, the machine on a belt conveyor. The castings are machined within .002 inch of both square and parallel. The machine is 118 inches high overall, occupies a floor space of only 64 square feet and is driven by a motor mounted on a top plate, which is, of course, concealed in the photograph. The drum is mounted on an axle 13⅜ inches diameter, and is driven from each end by huge worm and worm wheels 29 inches in diameter. These figures show clearly the massive proportions of the machine.

Another example of the drum type is shown at Fig. 3. In this case the machine has a 42-inch worm wheel drive and was built to mill the top and bottom of a passenger car cylinder block at the rate of 240 every eight hours. The drum as before is six-sided, and in this particular machine the weight is 25,000 pounds.

One might go on indefinitely illustrating different applications of this type of miller, but let us merely show one more.

At Fig. 4 is shown a machine that was built to mill the end of cylinder heads on a farm tractor motor. The weight of the machine in this case is 27,000 pounds, and it is driven by a 42-inch worm wheel. It has a five-sided drum, the surface of which is designed to accommodate fixtures for twenty castings. As will be noted the castings are arranged in two rows, four on each side of the drum. The photograph was taken while the machine was idle, and shows only one side of the drum loaded. One hundred and forty castings are finished every hour on this machine. These machines can be built in almost any form, so that it is impossible to give in a short article of this kind more than a few installations.

### Rotary Type

There are a number of continuous millers based on the principle of a revolving table turning beneath a column which contains fixed spindle heads, but the type shown at Fig. 5 is what is

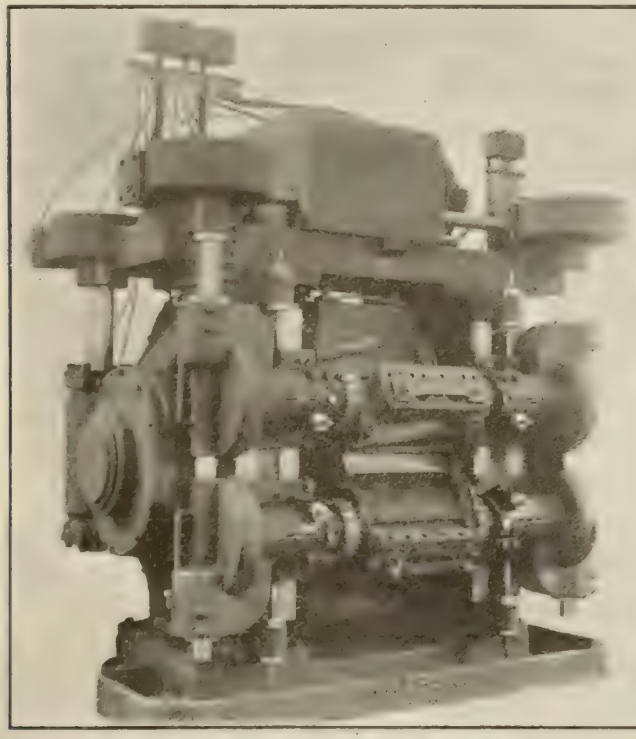

FIG. 1—DRUM TYPE MACHINE MILLING ENDS OF HEAVY DUTY TRACTOR MOTOR.

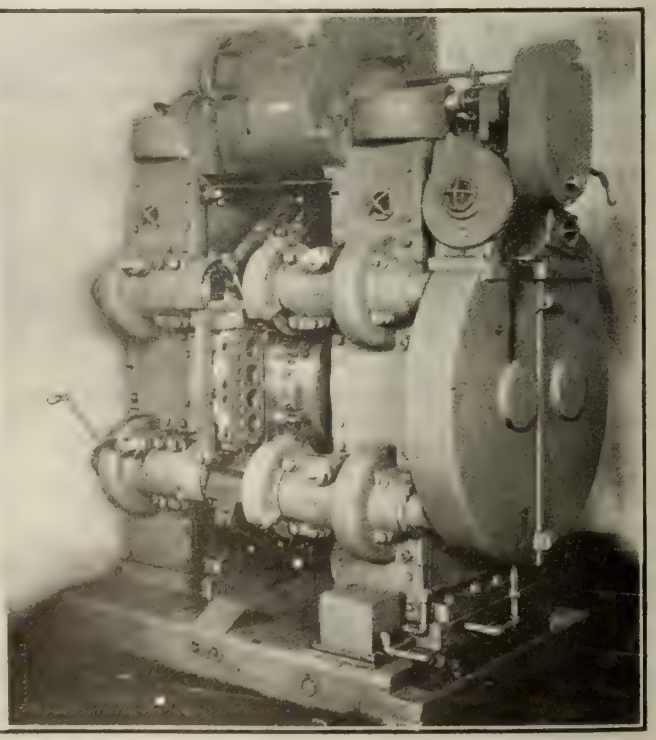

FIG. 3—ANOTHER DRUM TYPE MACHINE. OPERATION IS THE MILLING OF TOP AND BOTTOM OF PASSENGER CAR CYLINDER BLOCK.

known as a rotary table miller. This style machine is built with one or more spindles, and Fig. 5 illustrates a single station, two spindle type machine. It will be noted that two cutters are used, one for roughing and one for finishing. The work being accomplished is the milling of the top and bottom of a cylinder head for a four-cylinder motor, and with the equipment shown 30 castings per hour are produced. The machine depicted weighs 10,000 pounds and occupies only 24 square feet of floor space. The fixtures used hold two castings in the first operation and two in the second.

The next illustration, Fig. 6, depicts what is known as a single station circular table machine. It will be noted that in this case the table revolves around a centre column, which also supports the head carrying the spindles. The machine illustrated was designed for milling the bottom of passenger car cylinder blocks, two cutters being used for roughing and one for finishing.

The roughing cutters are at the rear of machine and a portion of one of these can be seen in the photograph. Eight-inch cutters are used for roughing, and a 14-inch cutter, as shown in front of photograph, is used for finishing. The table of the machine is 60 inches diameter, and is fitted with five fixtures. The surface milled is shown in diagram form at B in Fig. 2.

This type of machine requires only a single operator. He merely unloads and reloads the fixtures as they revolve past him at the station beyond the finishing cutter. This machine is particularly useful where both roughing and finishing cuts have to be taken on pieces that are comparatively long, whereas a multiple station machine of the same type will give better results where the surfaces to be milled are shorter.

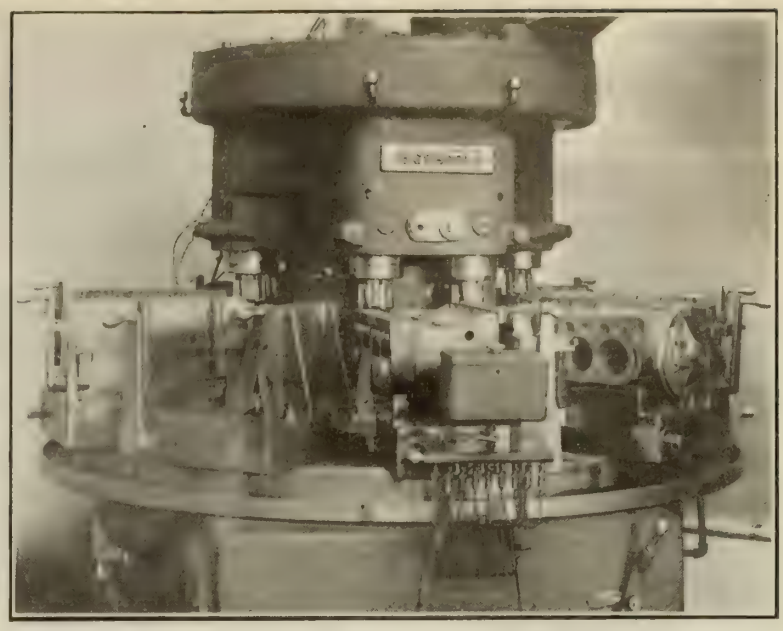

FIG. 7—THREE-STATION MACHINE DESIGNED FOR MILLING SMALL SURFACES ON THE SIDES OF CYLINDER BLOCKS.

Such a machine is shown at Fig. 7. Here we have a miller with six spindles, and three stations, yet requiring only 45 square feet of floor space. The work being done is the milling of a starter bracket pad on the side of an automobile cylinder casting. Both roughing and finishing cuts are taken, each station having a set of two spindles. Nine fixtures are fitted to the table and three men are required to unload and reload the work. Each man takes care of the output from his own particular set of spindles.

The amount of floor space saved by the use of such a machine is self-apparent and, as we know only too well, floor space in a manufacturing plant is a very necessary thing. Such a machine is well adapted to work of this nature, in fact to any work where a small pad at one side of a comparatively large casting has to be milled. Forty castings are produced every hour with this equipment, and the surface milled is clearly shown at C, Fig. 3.

**Reciprocating Type**

A rather interesting style of continuous miller is shown at Fig. 8, this being known as a two-spindle reciprocating type. This machine was designed for milling the pads on two surfaces of a transmission bell housing. Thirty castings are completed every hour, and the

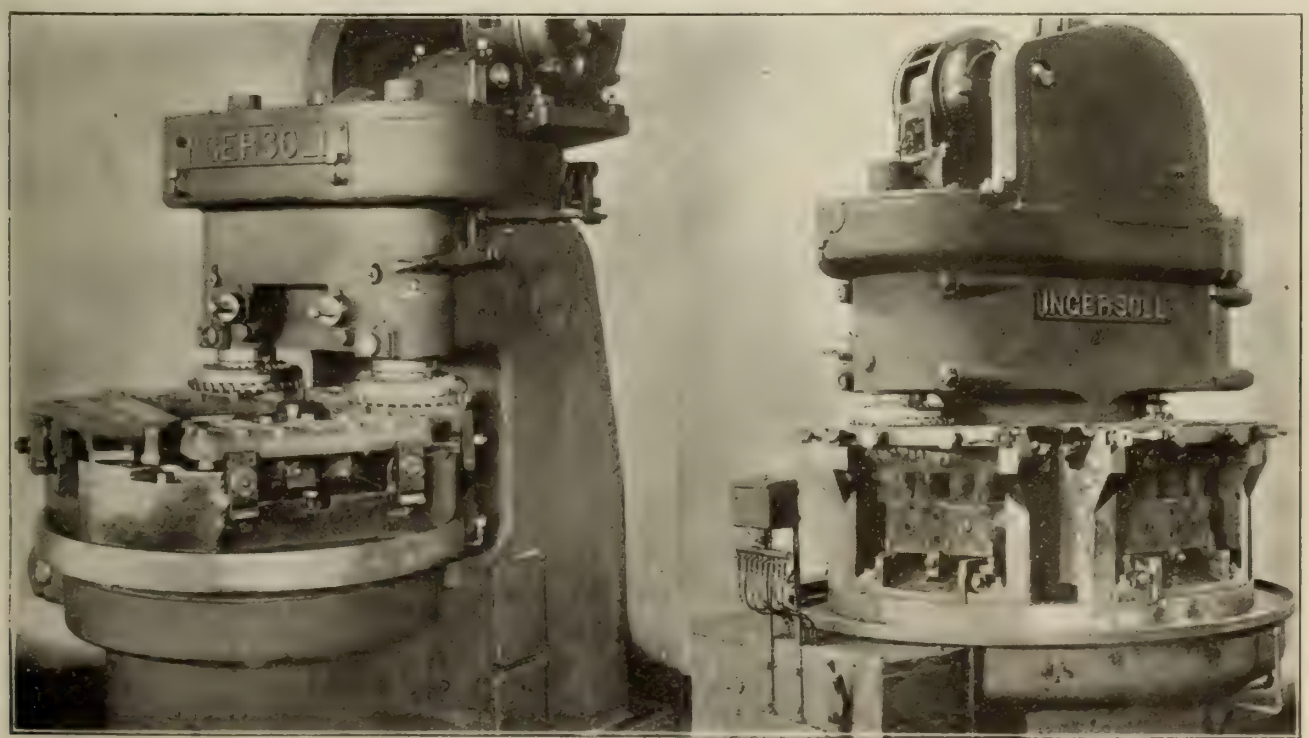

FIG. 5—A SINGLE STATION TWO-SPINDLE MACHINE MILLING TOP AND BOTTOM OF CYLINDER HEAD

FIG. 6—A SINGLE STATION CIRCULAR TABLE MACHINE MILLING THE BOTTOM OF PASSENGER CAR CYLINDER BLOCKS

machine itself weighs about 9,000 pounds, and occupies 36 square feet of floor space.

It will be noted that in this type of machine the continuous feature is not obtained through any revolving table or heads that carry the spindles. In this case the table is of conventional style, and is fed longitudinally and alternately in opposite directions. The table feeds, however, are automatic and continuous. Two fixtures are placed on the table, and while one casting is being milled the other fixture is unloaded and refilled with a rough casting.

The operation of this type of machine is very simple. After the first casting has been placed in the fixture, the table feed is thrown in. This takes the table forward at a high rate of speed until it approaches the cutter, when the speed is automatically reduced to the working speed, and continues to feed the work into the cutter at this rate until it has cleared the piece. When this cut is being completed the other fixture is being loaded.

The first piece being completed, the table feed is automatically reversed at a high rate of speed until the casting in the second fixture is brought up to the cutters. Again the feed is automatically reduced to working speed, and the same cycle repeated. The time of these changes is so arranged that the operator has ample time to load and unload his work, but should it be necessary to stop the machine for any reason, a throw-out lever is ready at hand.

### Fixtures and Cutters

It will have been noticed throughout the description of these machines that merely a passing remark has been made regarding the fixtures and cutters used. This was done, not because of their unimportance, but through a desire to leave this subject to the last. It is easily understood that to make any machine efficient, the very best fixtures should be used. The operator can handle a well-designed fixture quickly, feeling sure at the same time that the piece is located properly. In other words, the operator requires confidence in his fixtures. The human element is practically eliminated, in as far as the machines themselves are concerned, so that in continuous milling, or in fact in any production work, it is equally important to make fixtures as foolproof as possible. This is said in all due respect to the operator, the idea being to help the workman, rather than cast any reflection on his ability. The concern whose machines we have illustrated tell us that they themselves lay no great claim to standardization of fixtures. As they put it, "We make each fixture to suit the work, as after all each is a special job in itself."

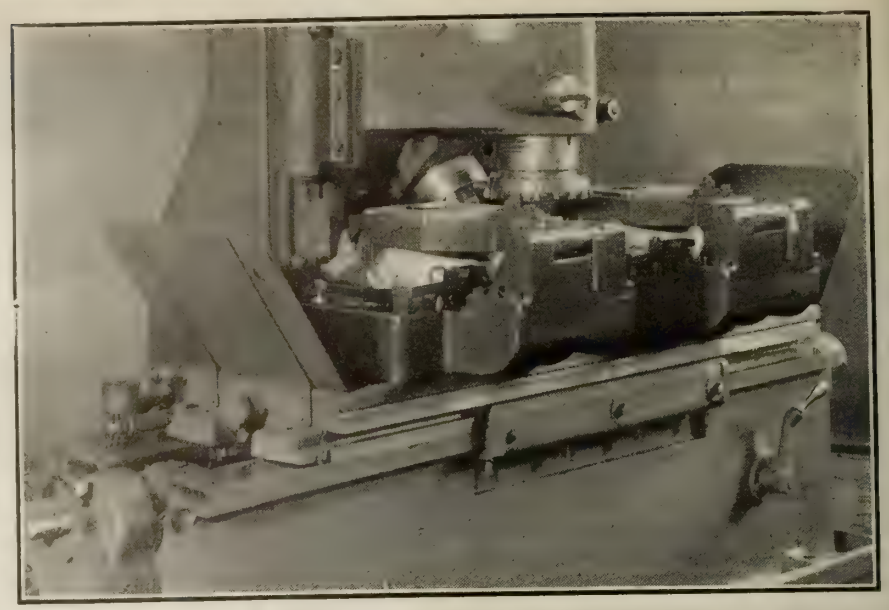

FIG. 8 TWO-SPINDLE RECIPROCATING TYPE OF MACHINE, USED FOR MILLING THE PADS ON TWO SURFACES OF A TRANSMISSION BELL HOUSING.

There are occasions in jig and fixture work where standardization of fixtures is a good thing, but in cases such as we have illustrated, and where the work is of a varied nature, each proposition requires different handling.

Of equal importance with the fixtures is the cutters. A cutter that will produce satisfactory results on one job will not always do on another. As a rule, however, a standard form of cutter will cover the majority of cases. The inserted tooth cutter is perhaps the best of any for work of the nature we have been describing, and Fig. 9 gives a good idea of the form of such cutters. As stated before, however, there are cases where it is wise to make special cutters to suit the nature of the work. After all, it is largely a matter of experience, and in a case where one is undecided they can readily call on the aid of the manufacturers themselves, who through experience are more familiar with such problems. There was a time when manufacturers were not so free with their advice and information, but this change is only another sign that we are waking up to the fact that it doesn't pay to build a stone wall around ourselves, for, if we do, we not only keep others out, but keep ouselves in as well. There is no reason why anyone should fail in a manufacturing problem to-day with the splendid advice at hand on all sides. This applies not only to continuous milling, but to all other manufacturing operations as well.

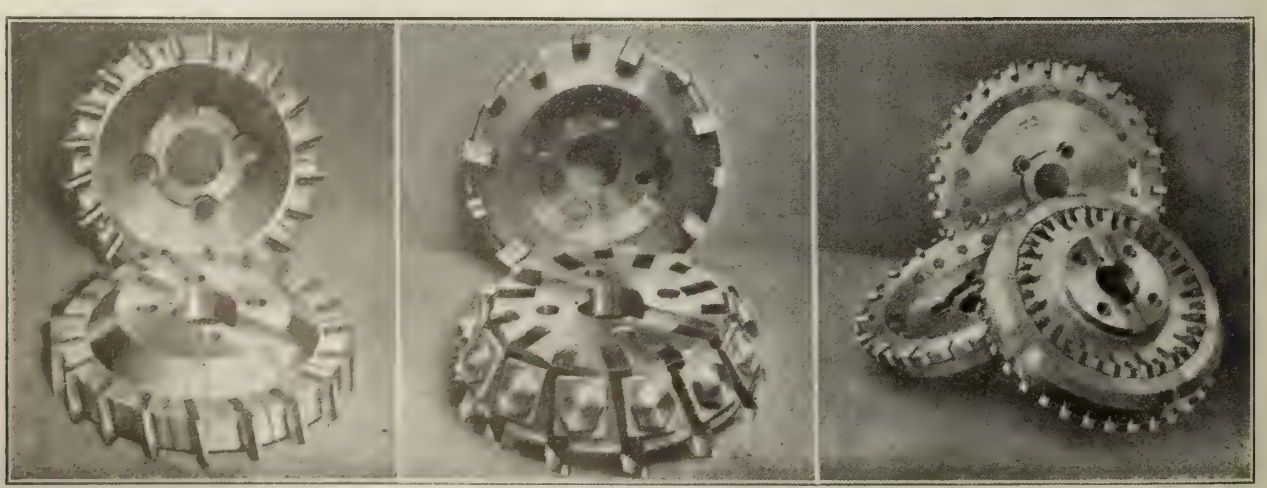

FIG. 9 SOME OF THE STANDARD INSERTED TOOTH CUTTERS. READING FROM THE LEFT THEY ARE KNOWN AS TYPE A, B AND Y.

# Continuous Milling of Six-Throw Crankshafts

## Milling of Shafts to Definite Length—Milling Both Ends of Six-throw Crank Shaft—Machining a Cast Iron Frame of Extremely Light Section—Milling Cylinder Block on Top and Base

IT is, of course, easily understood that we cannot attempt, in the space at our command, to treat the subject of continuous milling from every angle. In fact, we are lucky if we even hit the high spots. The subject could be talked about indefinitely, and still some new example of its use would be sure to crop up.

However, let us present some further examples of such work, and in this case we are indebted to the Newton Machine Tool Works, Inc., Philadelphia, Pa., for the illustrations shown. As we have already covered the main idea of continuous milling, viz., larger production, with a minimum of lost time, let us proceed to the illustrations.

Fig. 1 depicts the milling of 1⅝ inch diameter shafts to a certain length. These pieces are produced at the rate of 250 per hour, and the work is accomplished on a continuous type of machine specially adapted for facing work of varied nature. In this particular operation the intermittent feed and rapid traverse mechanism is used. That is to say, when the pocket containing the pieces has passed the cutters, the feed automatically trips and engages the rapid traverse, this advancing the work holding drums at a ratio of 10 to 1. Just before the next pocket containing the shafts comes into place, the rapid traverse is tripped, and the feed motion is re-engaged.

The loading of the drums is performed on the opposite side to that shown on the photograph, and the declampage, and unloading of the drum in this particular operation is automatically performed. It will be observed from the photograph that the clampage is obtained through a toggle lever. As the drum rotates, this lever is released by coming in contact with two studs that are bolted to the housing of machine. This allows the shaft to roll on to the pans, which have an inclined surface as shown. From here they go into a tote box, and in some cases on to a roller conveyor. In the application shown there are ten stations or pockets on the drum, each holding three shafts.

Fig. 2 depicts the same type of machine set up for milling both ends of a six throw crankshaft. It will be noted that the jig locates the shaft by the plungers in the center, and that they are placed alternately, this bringing them so close that the jump mechanism, as used on Fig. 1, is not necessary. The production on this work is 90 shafts per hour. The shaft overall is 33 31-32 inches in length, and the large flange end is 5 1-64 inches diameter.

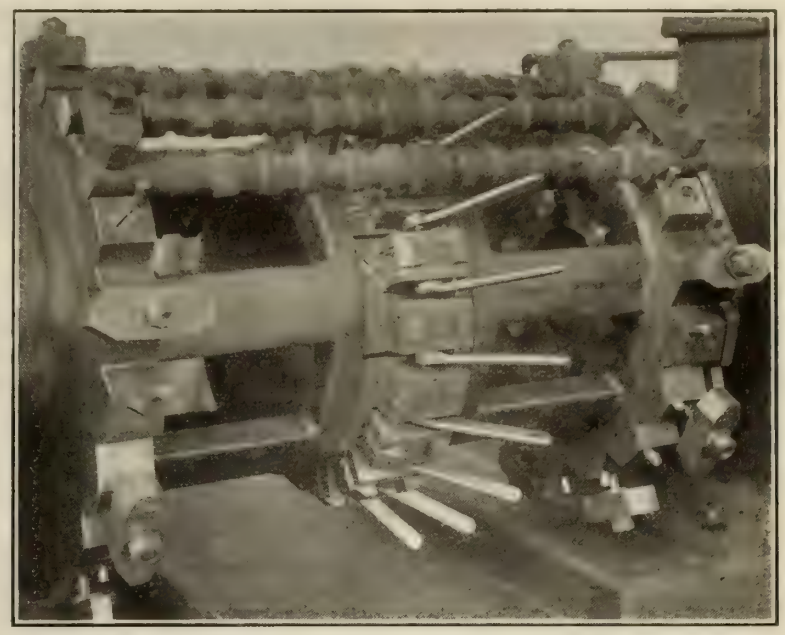

FIG. 3 DOUBLE FACING CAM SHAFTS.

### Another Example

At Fig. 3 is shown another double facing operation, the work in this case being a cam shaft. In this jig you will notice that the cam shaft is located by a universal chuck in the center, this working from the center bearing. The pieces are again placed so close together that the jump feed is not necessary. The production in this case is 180 per hour, the shaft being 1 5-16 inches diameter and 30 29-32 inches long.

The next operation, Fig. 4, is the machining of a cast iron frame of very light section. The piece is clearly shown on the photograph, and owing to its peculiar shape it requires rather elaborate jigging to ensure the piece being machined without distortion. It is ma-

FIG. 1—MILLING 1⅝" SHAFTS TO A DEFINITE LENGTH.

FIG. 2 THE SAME TYPE MACHINE MILLING BOTH ENDS OF A SIX THROW CRANKSHAFT.

chined on both ends, and is 4½ inches deep in section by 18 15-16 inches long. Forty-five pieces per hour are produced.

All these examples are produced on the same type machine, and briefly here are the chief points that will interest the designer especially. One head of the machine is mounted stationary at the end of the base, while the other head is adjustable so as to take care of work of varying lengths.

There is individual adjustment to each cutter spindle for setting the depth of cut, and for accurate work both roughing and finishing cuts are taken. The bearings of machine are oiled by a cascade system of lubrication, so that the machine does not require skilled help in its operation. The chief point is to learn the method of inserting the parts in the jig.

The cutter spindles are driven by worm and worm wheels, and the drum spindles are revolved by gears, both of which are driven by a common pinion, so that there is no possibility of their being out of register one with the other.

### Drum Type

Next let us view an example of work on the drum type machine. This class of milling is especially adapted for machining surfaces, and can be utilized for machining one surface on two castings, or two surfaces on one casting at the same time. The photographs shown illustrate the milling of two surfaces on all castings, as, by so doing, one handling operation is avoided. In other words, if two castings are placed side by side, and only one operation performed on each, it will require double the amount of handling.

In Fig. 5 is shown a cylinder block being machined both on the top and base. Note that two small cutters are used for roughing, and one large cutter for finishing the surface of the block. It will also be observed that these cutters are not operating upon the same section simultaneously. By machining both operations at the same time absolute parallelism is obtained, whereas if these surfaces are machined separately a certain inaccuracy is almost certain, not to speak of the loss of time.

All spindles on this type machine have individual adjustment and are driven by worms and worm wheels, so arranged that the cutting speed of the finishing cutters is 80 per cent. of the cutting speed of the roughing cutters. Various speeds to the cutters are obtainable by pick-off change gears. The drum is rotated by herringbone gear through worm and worm wheel at predetermined rates which are also variable by the use of pick-off change gears. The drum spindle is of double taper bearing construction with very fine adjustment to prevent any end motion, the other bearing of the drum spindle being provided with a take-up bushing of the split taper type.

It will be observed that all gearing, splined shafts and revolving parts are fully enclosed and run in a bath of oil, pumped from the reservoirs on either side of the machine, to which, of course, the oil returns after having passed through the various bearings. All slow running bearings, such as the spindles, which are lubricated by pipe connections, have a special system of oiling in order that they do not become flooded. In the chucking of the piece, one clamp with a double bearing is used which simplifies the handling operation. Machining the top and the base of the cylinder block is accomplished at a production of 25 pieces per hour. This production has been very considerably exceeded in test operations, but the figures given are production figures only.

Various other photographs have come to the writer's attention on this particular class of machine, but enough has been shown to illustrate its possibilities. Here are a few production figures that we have gathered as average cases. Surfacing the ends of a cylinder block, 35 per hour. Machining both ends of a gear case, 40 per hour. One big feature (which has already been mentioned in the first article in the issue, but which is well worth repeating) is the saving of floor space by the use of such machines. It is claimed that in some cases as high as 80 per cent. of floor space has been saved, 40 per cent. of labor cost and 20 per cent. by machining both sides of pieces at one time.

# Auxiliary Drill Heads As An Aid to Production

## The Benefit of Having an Auxiliary Head for Some Special Job—Construction of Common Type of Drill Spindle—Sectional Views Showing Design of Drill Heads—Capacity of Drive Important

By F. SCRIBER.

BY F. SCRIBER

AMONG production units are often found the so-called auxiliary drill heads, these being used as an aid to production. The word **auxiliary** is used presumably because these heads are attached to the spindle, or spindles, of drill presses and have a number of small drill spindles contained in them so that two or more holes may be drilled simultaneously. These heads are usually made specially to accommodate some particular job that is made in sufficient quantity to warrant the expense of making such a drill head. There are, of course, heads on the market that have adjustable spindles that will drill two or more holes at various center distances within the capacity of such auxiliary drill heads. The purpose of the present article is to explain how these heads may be attached to drilling machines, and a few examples of drill head construction are likewise shown.

By referring to Fig. 1 a clear idea of the general construction of a common type of drill spindle may be had. In this illustration A is the drill spindle, B is a ball bearing which takes the thrust of the drilling, this thrust in turn coming against the quill C in which the drill head spindle is revolvably mounted. At the top of this quill is placed a collar D. This holds the spindle in place, while a

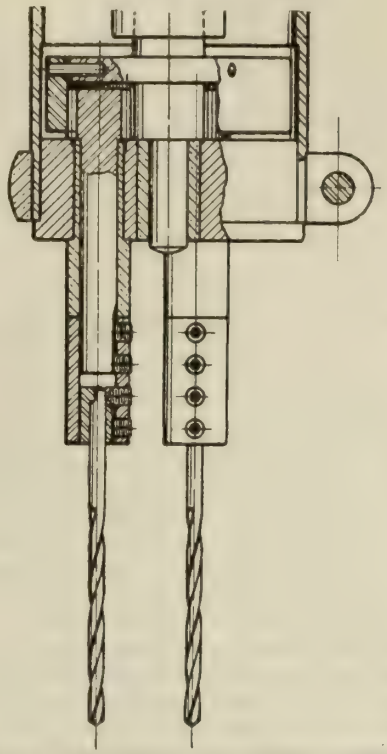

FIG. 1 THREE-SPINDLE FIXED CENTER DRILL HEAD.

rack E is also attached to this quill for feeding purposes. Through the bracket of the drilling machine is placed a stud to which a gear F is mounted. Handle G revolves this shaft, thus turning gear F and moving quill C as required to do the drilling. Spindle A is caused to revolve by having a pulley mounted at end X, while at H is shown the tapered hole in the spindle with what might represent a drill shank inserted therein, all of which is common to one type of drill press, most drill presses being constructed either with single spindle along the same lines, or with a number of units that correspond.

### Three Spindles

A three spindle drill press is shown in Fig. 2, in which this construction is embodied. This illustrates how belts A Fig. 2 drive the spindle and is used to amplify the description which follows.

In Fig. 3 is illustrated a modification of the quill and spindle shown in Fig. 1, where it will be noticed that the quill A Fig. 3 is made of hollow tubing with bushings B and C mounted therein. In these bushings are placed suitable bronze bushings D and H in which the drill spindles revolve and at F and G are shown the gear and operating lever together with the rack E, these being substantially the same as in Fig. 1. The particular feature to be noted in this construction is that the main driving

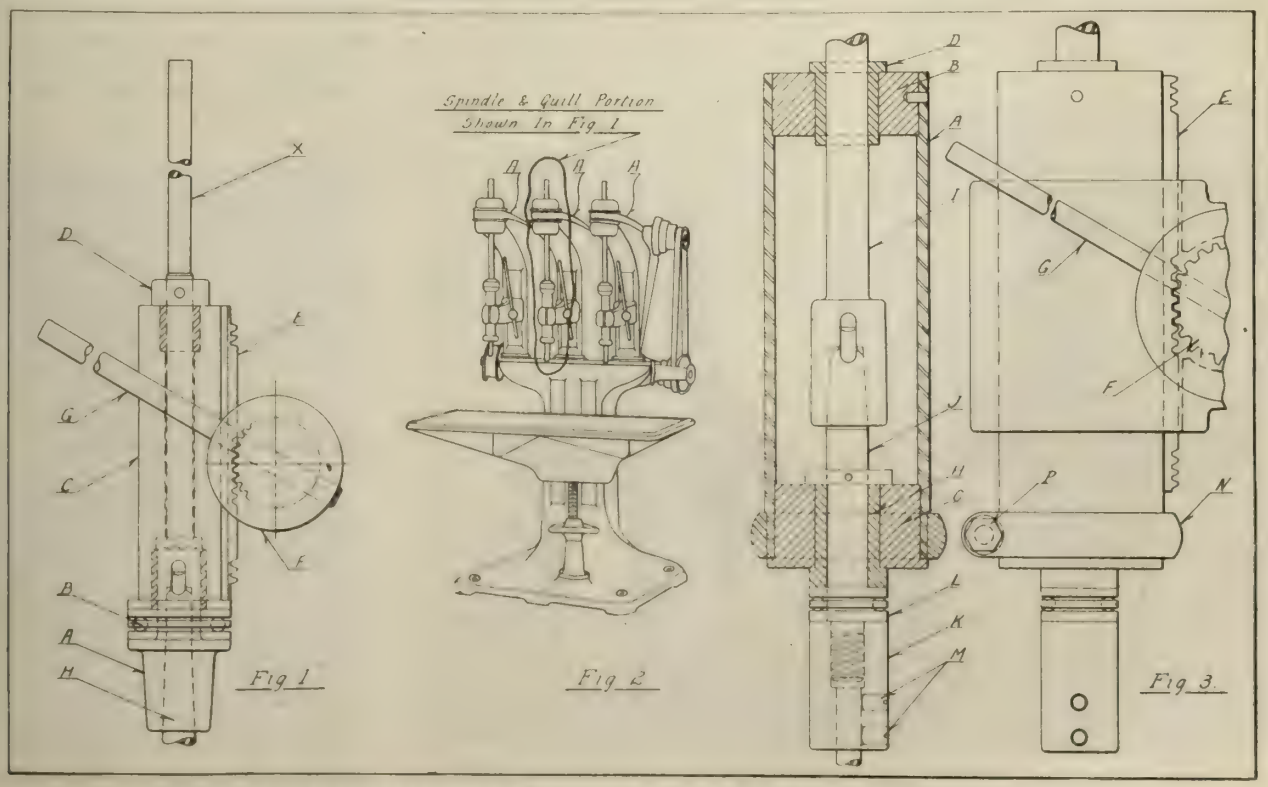

FIG. 1. GENERAL VIEW OF DRILL SPINDLE CONSTRUCTION.
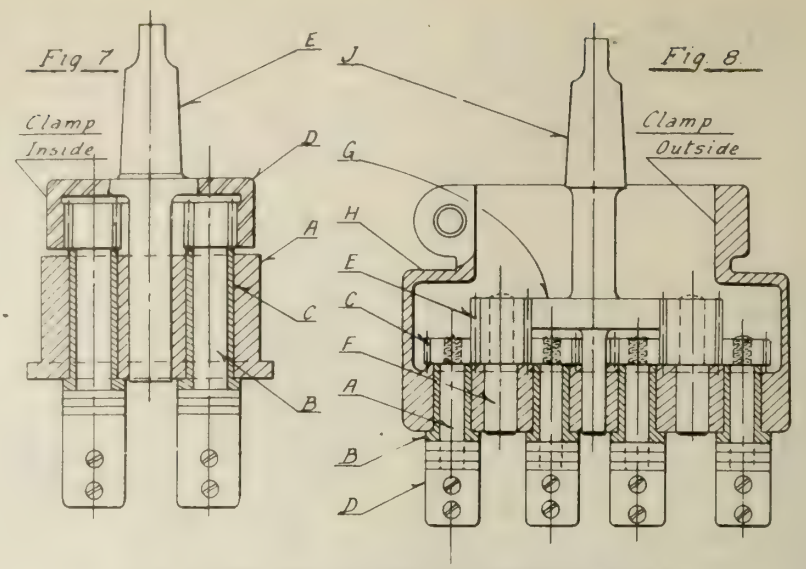
FIG. 2. SHOWING HOW MULTIPLE DRILL HEADS ARE APPLIED.
FIG. 3—SINGLE SPINDLE WITH QUILL ARRANGEMENT.

spindle I ends inside of the hollow quill, and a small spindle J with a tapered shank on it is inserted in the end of the main spindle to which is mounted a drill holding sleeve K, this sleeve being threaded in place with the ball bearing L above it to take the thrust of drilling, while two screws M hold the drill in place. The lower end of the hollow quill has a slot cut in it, and a collar N is mounted on the lower end, this having a set screw P as shown. The object of this collar and screw is to clamp the bushing C securely in place.

In this construction one spindle only is shown, but should it be desired to put in two or three small drill spindles, the bushing C may be removed and a new bushing containing the desired number of small spindles inserted in its stead. These spindles will be geared together on the upper side of the bushing and when thus arranged would be driven by a center stud entering the drilling spindle I in substantially the same manner as is employed for driving the one shown. Fig. 4 gives a good idea of how this can be accomplished, although in this particular construction the spindle of the machine was not made as a hollow quill, but the two drill spindles were mounted in a sleeve. This sleeve was clamped to the regular quill on the machine, and moved up and down with the same in the usual manner.

To further amplify the last construction, and as a means of showing one type of adjustable drill head, let us refer to Figs. 5 and 6. Here are views showing a three spindle adjustable drill head in two extreme positions. Fig. 5 illustrates the drills set at their closest center distances, while Fig. 6 illustrates the same drills set to their greatest center distances. In this construction the drills A are mounted in chucks B, the ball bearing C taking the thrust of the drilling. The drill in the center at D is fixedly mounted to the body of the drill



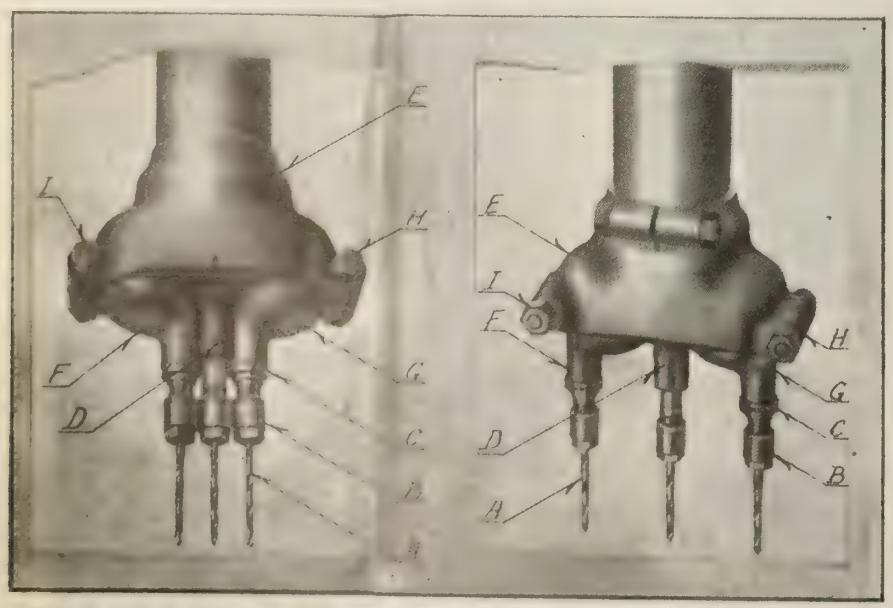


FIG. 7 TWO OR FOUR-SPINDLE INTERNAL DRIVE.
FIG. 8 FOUR OR MORE SPINDLE INTERNAL DRIVE.

head E, while the two outer drills are mounted in carriers F and G in such a manner that they are allowed to pivot about a central point and when set to the required centers may be locked by screws H and I, it being obvious that if two holes only are to be drilled the center drill may be omitted from its chuck, thus leaving only the two outer drills to do the work. If the required centers are closer than what can be obtained by this method, one of the outside drills could be omitted. It is obvious that more than two carriers could be mounted in an auxiliary drill head body, in fact the number of spindles which could be carried is only limited to the driving power of the machine and its practical working capacity. This auxiliary drill head is clamped to the quill of the drill press and travels with the same in the regular manner as if the drill spindle was only making the hole.

Fig. 7 shows a bushing A which contains two drill spindles B and C. These spindles have gears mounted on the top, the gears being driven by an internal gear D. The internal gear is made with a shank on it at E. This entire arrangement is suitable for insertion in the hollow quills shown in Fig. 3, or Fig. 4, and can be used for drilling two or more holes, this depending of course on the capacity of the quill, although it is to be understood that holes drilled with this arrangement of gears would be equal distance from a common center, as there is no adjustment.

To complete the general description, Fig. 8 has been drawn with four drill spindles fixably mounted at different center distances, the four spindles being represented at A, and mounted in bushing B, with gears C, at the top to drive them. The drills are held in chucks D at the lower end of the spindles. Between these spindles are located two gears at E, which revolve on studs F, and a gear G drives these two intermediate gears, which in turn drive the drill spindles. This arrangement of spindles and gears is contained in a casing H, which is clamped on the outside of the drill press quill, while the tapered portion J on the center gear fits into the drill press spindle and is driven thereby.

If the gears in an arrangement of this type are not made to drive all of the spindles in the same direction it will be necessary to use drills having right or left hand spiral grooves depending on the direction of rotation. These drill heads are most advantageously used when made to work with jigs to do one definite class of work and are made with so called straight line drives, or with holes located in a circle or staggered, it being necessary to exercise considerable judgment in devising tools of this type to make sure that more drill spindles are not incorporated in the design than what the capacity of the machine will drive.

FIGS. 5 AND 6 SHOWING THE TWO EXTREME POSITIONS OF A THREE-SPINDLE ADJUSTABLE DRILL HEAD.

# Do You Tolerate Any Dead Time in Your Plant?

## The Importance of Watching How Material is Handled—It Pays to Devote a Fair Share of Time and Thought To The Subject—Added Production at Lower Cost Will Follow

By M. R. MELDRUM *

CUTTING down the dead time is a matter of first importance to every owner of a machine shop, large or small. Consequently the superintendent or foreman who is alert and keen will be constantly on the watch for means to reduce the time spent on anything which is not actual production. It is strange, however, that so much time and energy is devoted to saving seconds on machining operations—time-studies, moving-picture studies, cost analyses, etc.—while a great source of lost time and lost motion remains almost untouched in the average plant.

Machine shops equipped with batteries of the most modern machine tools representing a capital investment of many thousands of dollars are regularly losing a large proportion of their carefully planned economics for lack of intensive study of material handling. What is the advantage of saving ten seconds on a milling operation when the workman has already wasted ten minutes in getting the job into the machine? Where is the saving effected by using a second head on a boring mill when a "helper" must be employed to assist in lifting fly-wheels or gear blanks on to or off the face plate? This article is intended to suggest to the progressive manager a few of the many places around a machine shop where a few hundred dollars invested can earn as much dividend as a much larger amount spent on the actual productive equipment.

Take the hack saw or cutting off machine. A piece of round bar is to be cut up for turning and key-seating. The bar weighs perhaps 500 pounds. Two men are told off by the foreman to get it from the stock rack and put it into the saw. It is heavy lifting, and, quite apart from the risk of serious accident, the men feel entitled to stand and chat for a few minutes after the bar has been set up, leveled, and the saw put in motion. Say five minutes each, ten minutes lost time in all. A length of I-beam hung from the roof, a trolley running on the lower flange, a chain-block suspended from the trolley, and one man can do the job unaided. The danger is eliminated, fatigue is avoided, and one opportunity for a chat has not been presented.

### The Case of the Grinder

Now let us take a look at the grinder. How seldom does one see a quick-acting hoist placed where it will assist the operator to hold a heavy piece steadily at just the right height and with just the right amount of pressure on the wheel. And yet the grinding machine can absorb more time, produce more rejected parts and cause more nasty accidents than almost any other tool in a machine shop. Think of the emery wheels burst through misuse, think of the fingers and arms damaged by the man slipping with an awkward shaped piece. With a chain-block conveniently hung, the casting is balanced so that the operation can be correctly performed, the work checked and re-checked as metal is progressively removed and time is saved because the operator has confidence in his equipment.

### The Lathe

A lathe is more commonly supplied with a chain-hoist than most of the other machine tools, perhaps because so many manufacturers realized during the war the time-economy on shell production resulting from the installation of proper handling devices. But the relative merits of a jib-crane, an overhead crane or a length of overhead track are not always sufficiently considered. The rig that is right for handling shells is not necessarily correct for wheels, shafts, armatures or flanges. The routing of the material, the form of the tote-box and many other factors should be allowed to influence the selection of the handling equipment.

### The Planer

The planing machine is another tool which is often sadly neglected. Because it is a stately looking machine, with relatively slow, ponderous movements, is no reason why it should be allowed long seasons of rest between jobs. On the contrary, when the table is quickly unloaded and as quickly recharged, the percentage of saving is often a surprise as well as a delight to the manager. In the illustration shown, the planer in the background is fed by means of the overhead crane. No special construction was required. The crane runway was simply suspended from the roof and the crane runs on the bottom flanges of the beams. The bridge beam extends almost to the columns supporting the roof so that every inch of floor space is available.

Now let us take a look at the boring mill. This tool is fitted with a turret head holding cutter bars, reamers and turning tools, with a self-centering chuck, quick power traverse and a foot-brake, all to hasten production. The addition of a speedy little electric hoist, conveniently swung from a jib-crane, makes the installation complete and prevents the time gained in machining from being frittered away in handling. But the hoist must be compact, for most shops have insufficient head room for a long, cumbersome hoist. It must have

*President, Herbert Morris Crane and Hoist Co., Ltd.

THE USE OF THE CHAIN BLOCK IS OFTEN FORGOTTEN WHEN IT COMES TO THE LOWLY HACKSAW.

RELIEVE THE STRAIN AT THE GRINDING WHEEL IN THIS MANNER.

a large factor of safety, because very few machinists can accurately gage the weight of a casting without doing some figuring. It must have such safety devices as a self-centering controller and a limit switch designed to cut off the current when the hoisting hook threatens to run into the overhead gears. The lubricating system should be very simple so that the machine operator can fill up the reservoirs at the same time and with the same lubricant as he employs on his machine tool.

In nearly all of the foregoing applications of mechanical hoisting equipment, an almost indispensable adjunct is a trolley with a short piece of track. The trolley should be very free-moving so as to be quickly responsive to the will of the operator. For this reason roller bearings are a necessity rather than a luxury. For good results, both as to ease of running and long life with low maintenance cost, the rollers should be large in diameter, completely enclosed and perfectly lubricated. It is a mistake to suppose that a bundle of steel wires can possibly constitute a roller bearing in the sense that they will eliminate friction.

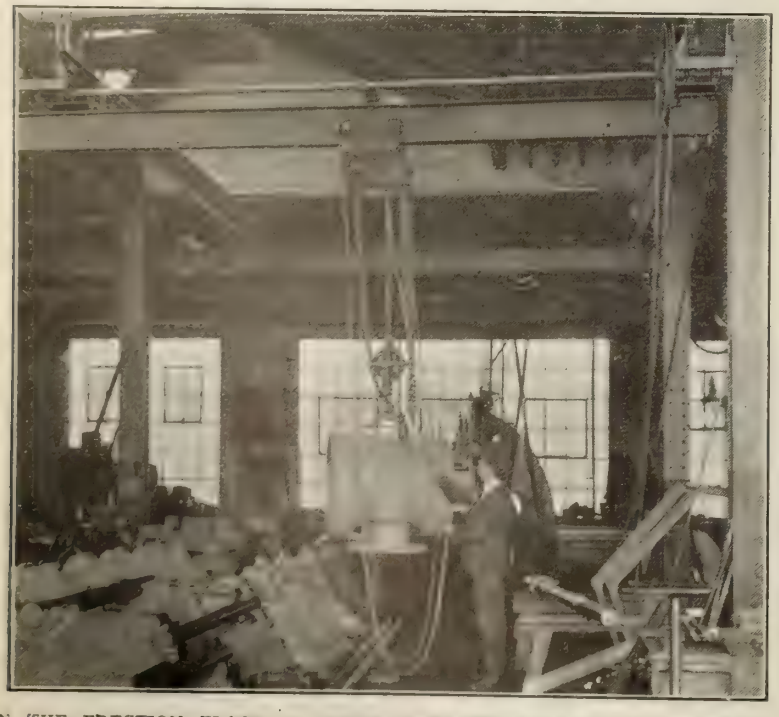
The best form of track or runway is undoubtedly an I-beam, though two channels, back to back, will serve almost as well, provided that the bolts or rivets connecting them do not project so far as to interfere with the use of a standard trolley.

Sometimes a roof beam or the tension member of a roof truss may be utilized to advantage. But care should be taken to check up the strength of the structure before applying a load which was probably not included in the architect's calculations. It is also poor economy to use an existing structural member unless it happens to come just in the right place to serve the machine efficiently .

Occasionally a flat-bar track offers advantages in lower first cost as compared with the I-beam. This occurs mainly when the roof or ceiling is supported on wooden joists at 16-inch centres. The hangers can then be closely spaced and the light track well supported at short intervals. Otherwise it may be necessary to provide a wooden supporting beam over the full length of the rail, and the economy of first cost immediately disappears.

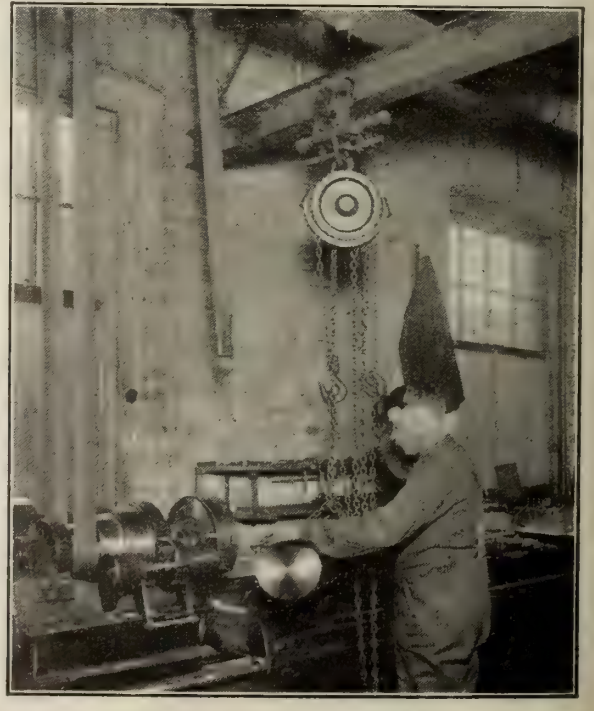
The question of suspension by means of suitable hangers is worth a little study to ensure that the building will not be damaged and that the track will be properly supported so as to provide a strong, stiff, straight and level path for the trolley. Standard hangers are obtainable and they offer the advantage of facilitating erection by avoiding the need for drilling holes either in the track or in the structure.

Standard twelve-foot lengths of track, complete with hangers, end-stops, trolleys and lifting gears offer a very easy solution to many a handling problem for the busy executive. The only equipment still required is a suitable sling or bale, and even these accessories have been developed to a highly practical extent on thoroughly standardized lines. A well-designed grab or sling is like a giant hand to aid the workman: it takes hold instantly, grips the piece firmly and releases promptly; a good sling completes the equipment of labor-saving machinery.



Many superintendents are allotting to this subject a fair share of their time and thought, and we think that enough has been said to show that it is an important function of shop management. Adequate handling facilities will not in themselves make money for the owner, but they will at least permit him to keep the money he makes in the use of his productive plant.

## DANGER TO BE AVOIDED



Greasy floors in machine shops are always a possible source of danger, and should, as far as possible, be prevented. In any case really dry sawdust should be used to absorb as much as possible of oil and grease, and sharp sand should also be applied from time to time to give a foothold, but this material should not be used in excess. Sawdust from non-resinous wood should be used for absorbent purposes where obtainable, as the grease passes into the fibre in such cases.

## HINTS OF VALUE

Shortly after a fire in a certain plant in England the following hints were given: Don't store oily cotton waste in a warm place at all, and don't store it where firing will cause danger anywhere. Under favorable conditions oily waste, as well as some other things, will oxidize rapidly, and in the presence of air will ignite through the heat engendered; and this should be thoroughly knocked into the heads of people handling the stuff in workshops, as it is quite easy to have a fire from some "unknown cause," or of which the "origin unknown" report is given by the fire brigade. Of course, as a waste product, greasy waste has some small value, but it is better to burn the stuff right away than to have a fire during a busy time. These hints, in a way, seem unnecessary, yet, strange to state, we still forget these simple precautions.

ON THE ERECTION FLOOR A CRANE IS PRACTICALLY INDISPENSABLE.

AN ARRANGEMENT AS SHOWN CANNOT HELP BUT AID PRODUCTION ON THE LATHE.

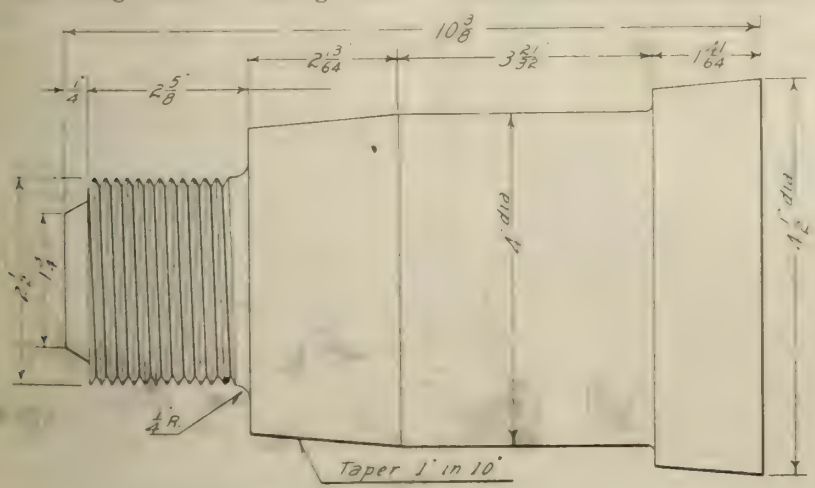
# WHAT OUR READERS THINK AND DO

# What is Your Opinion Regarding This Job?

## A Case Where the Salesman of a Firm Differed With the Superintendent of a Plant in Regard to Production of Cross Head Pins—Give Us Your Views on Making Pump Rods

By J. H. RODGERS.

THE superintendent of a certain railroad shop in Montreal was called upon some time ago by the representative of a well-known turret lathe manufacturer, and during the interview the question of cross head pins came to the fore. When it was learned that the company was taking an hour to produce one of these pins, from the bar, the salesman showed his surprise and intimated to the superintendent that it was possible to turn these out at the rate of one every twenty minutes; as a matter of fact, the machine had been advertised to do this. The superintendent was more than interested and sent for the machine shop foreman, who, when he came in, was made acquainted with the salesman of the —— company. This particular foreman was not a native of Missouri, but nevertheless was the kind that had to be shown. This the salesman seemed willing to do, and the twain adjourned to the shop and to the turret lathe used in machining the pins.



The salesman recognized the machine as one of their own, but of a design several years old. However, he was convinced, in his own mind, that too long a time was being taken in making these pins. Looking over the equipment he stated that it would be necessary to make a few slight changes before starting on the work. As it was then late in the day the representative said he would be in the first thing in the morning to commence work. The foreman asked him how long it would take him to do the first pin, and the reply was reluctantly given as "about an hour," and 20 minutes for those following. The foreman noted this on his pad.

Nine o'clock the following morning the salesman appeared. The machine operator had been busy for two hours cleaning up and getting things ready for him to start. The machine had been stripped and thoroughly cleaned, the bar ready, with the necessary tools and equipment neatly arranged on the floor in front of the machine. When the "20-minute man" saw the layout he turned on the foreman with the remark:

"You were making these pins last night. Why did you strip the machine?"

"The machine is generally this way when we commence a job," replied the foreman. "You will remember I asked you how long it would take you to do the 'first' one."

The foreman was not desirous of taking any mean advantage of the salesman, but he realized the position he might be placed in should the representative's efforts coincide with his statement of "20-minute pins."

DETAIL OF THE CROSS-HEAD PIN.

The salesman was given full scope to show what he could do, and his labors were finally rewarded. Four hours passed before he delivered the first pin —and it might be here stated that this one would not pass inspection. Before the day closed he succeeded in finishing a few others, and the best time for one pin was about 68 minutes. However, he apparently showed little disappointment and took refuge behind the statement that "he would send a man from the factory who would do them in 20 minutes." Several weeks later a man made his appearance at the shops.

"Are you Mr. Foreman?"

"Yes, sir."

"I'm from the ——— company."

"Here in connection with the cross head pins?"

"Yes. Could I see the machine?"

This fellow was a regular "dummy," and when he was taken out to the machine, he had nothing to say, just moved from one position to another, watching every move of the operator, saying never a word. This continued for several hours. At last he seemed satisfied, and turning to the foreman, who had just come up, he remarked:

"You have a 90 per cent. man there." (It might be mentioned that the operator had been tipped off and that he was doing his utmost.)

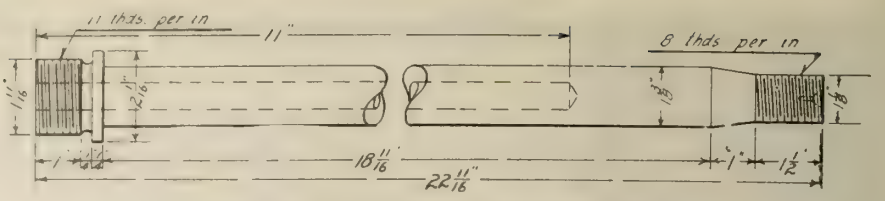
"Can you make the pins in 20 minutes?" asked the foreman.

"I think not, but I could cut your time considerably."

"Show me," said the foreman.

"I'll start in the morning," was the parting remark of the conservative talker.

This fellow must have retired early that night as he made his appearance shortly after seven the following morning. Without any waste of time or



words he started in, and to see that chap work would have put an old-time slave to shame, and have made Lincoln sit up in astonishment—if he were alive. The man seemed to be everywhere at once, and, after the machine was set up, he performed his work systematically, using his entire body in manipulating the various wheels and levers; arms, legs, hips, and probably his head, all apparently going at the same time. He came out of the mixup and succeeded in making a pin in 48 minutes. He told the foreman that he could do still better, but that he did not want to show up the workman.

"Never mind the operator," said the foreman, "show us the best you can do—the very best."

This he consented to do on the understanding that no mean advantage would be taken of the workman. "Go ahead," replied the foreman, "the time has been set at one hour, and it will remain at that, no matter what you may do."

Again the physical distortions started and with even more strenuous efforts—but the "best one" took him 68 minutes. He had a little trouble with his tools breaking. The average time the demonstrator made ranged from 48 to 60 minutes. The shop time remained at one pin per hour.

That the readers may have some idea of the pin in question a detailed sketch is given herewith. Opinion of readers on the production of these pins (or similar work) in quantity, from bar stock, would be appreciated, and would doubtless be very interesting to those working on such problems. The time under discussion is that required to completely turn the pin and cut the thread, ready for insertion in the cross head, with the exception of the drilling of the pin hole and the cutting of the keyway. Complete turning time, not just roughing.

HOW WOULD YOU MAKE THIS PUMP ROD?

### Another Piece

A query has come in from one of our readers as to what time it should take to make pump rods similar to that shown in the sketch. These are made from cold rolled stock, and the dimensions given are finished sizes. It is required to know the time taken to finish this piece from the bar, in readiness for insertion in the pumps. The time must be that taken for all roughing and finishing operations. Give details of tooling.

Editor's note.—We particularly desire readers to answer these queries, for by so doing they will be rendering a real service. We shall pay for all accepted material at regular space rates.

### STORAGE OF DRAWINGS

Whenever the subject of drawing storage is brought up, discussion is sure to follow. In discussing the subject Practical Engineer comments as follows:

So far as is possible all drawings should be made to some suitable scale which is uniform throughout the whole of the work done, and fixed sizes of paper should be used for the general sizes of drawings made, although occasionally a larger or smaller sheet may be required, and also it may be necessary to use a larger scale occasionally for the sake of greater clearness in the workshop. Many drawings are not of permanent interest and, sepaking generally, are not worth saving, but some things have to be kept and referred to for years. In such cases drawers should be provided slightly larger than the standard sizes of paper used, and in these drawers the drawings should be stored flat, the creasing or rolling of any drawing of a permanent character not being at all desirable.

Even cloth tracings are best kept flat, although they suffer less from rolling than does paper. Tracings on tracing papers should be always kept flat and uncreased, while the new paper should never be creased or folded, as the ink will spread and run in a disconcerting manner. Beyond this most tracing papers must be kept air-tight or they lose their transparency and become useless for practical purposes.

### NEAR PRIZE WINNERS

Here are the other ten readers who came so near to landing a scale: O. F. Anderson, Hartford, Conn.; Wm. Smith, New Liskeard, Ont.; W. K. Mulock, Winnipeg, Man.; P. J. Ryan, John Morrow Co., Montreal; William M. Plummer, Bolton, Ont.; B. Back, Hamilton, Ont.; Chas. E. Mars, Brantford, Ont.; E. W. Todd, Penetanguishene, Ont.; George Land, Peterboro, Ont.; Harry Browrigg, Stellarton, N.S.

Letters patent have been issued this week changing the name of the National Steel Car Co., Ltd., to that of Hamilton Car Co., Ltd.

## *Milling Machine Extension*

During these times, when work is none too plentiful, it makes one think a little before turning any jobs away from the shop. The writer received an order for quite a number of bevel gears which were so large that the table of the milling machine would not drop low enough to allow the wheel blank to pass by the cutter, after being tilted to the angle required by the dividing head. We decided to raise the spindle of the milling machine after the same manner often adopted on the lathe. The sketch, Fig. 1, shows the layout of the machine rigged up for the job. This fixture is composed of two castings, A and B, an enlarged view of one of these being shown at Fig. 2. The front casting, A, is bored and faced to suit the spindle C, the spindle being bored to take the taper arbor of the miller. The two gears D and E are used to drive the spindle, the gear E is threaded to suit the spindle proper, the gear D being keyed to the top spindle C; the overhanging arm is the one belonging to the machine. The change is easily made by taking off the caps of the bearing and inserting the two extensions and bolting in position. The machine is driven in the usual manner. This advice has given entire satisfaction and will be used for large spur gears in future.

# DEVELOPMENTS IN SHOP EQUIPMENT

### DRILL AND REAMER HOLDER

The Woodall-Basch Tool Co., Syracuse, N.Y., have placed on the market a drill and reamer holder as shown in the illustrations. These merely depict two of its uses. Briefly here are its characteristics.

The holder consists of a centre sleeve with a large head through which a T-slot is milled at right angles to its centre line.

This sleeve can be fitted to any taper or left straight as the need may be. It has a taper reamed hole to receive a centre that takes the place of the regular centre of the machine where the holder may be used.

Fitted to float freely in its T-slot is a head for holding drills or reamers, which consists of a malleable iron casting in the form of a collar connected at one end to a bar which is at right angles to the collar. This bar is the part that floats in the T-slot in the sleeve. In one side of the collar end of this head a "V" is formed and lined with hardened steel plate against which the tools are held by means of a headless screw. A hardened and ground steel centre is fitted to the taper of the sleeve and projects through an opening in the bar into the opening back of the collar. This centre takes the place of the regular centre and locates the tools on centre line.

The use of this holder is not confined to any one class of lathe, for practically all styles, even including turret and screw machines can make use of the device. It can also be used on drill presses with good success.

### ROTARY PISTON PUMPS

The St. Louis Pump & Equipment Co., St. Louis, Mo., have placed on the market four different styles of their duplex rotary piston pumps.

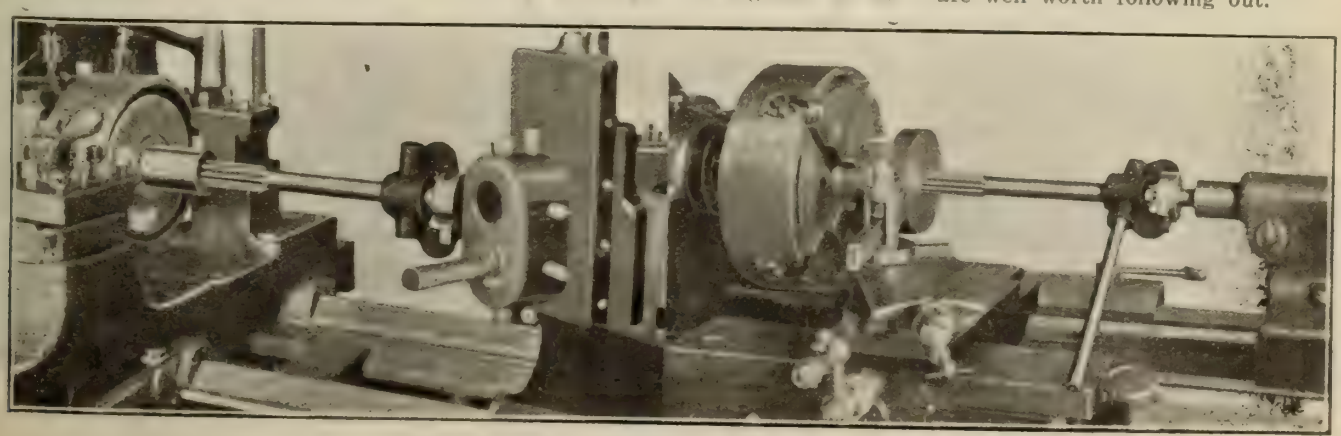
Briefly, the pump consists of twelve principal parts, these being the pump case with dividing partition, two end plates, a steel shaft with two eccentrics mounted thereon, two pistons, two rocker arms and two checks.

Two chambers or cylinders with shaft passing through centre of each—two eccentrics, directly opposite in throw or 180 degrees apart, mounted on the shaft. Surrounding these eccentrics are the two pump pistons. These pistons are pivoted to the rocker arm, which serves to produce the reciprocating movement of the piston through the action of the eccentrics.

In this way a composite reciprocating and rotary motion of the pump piston, without actual contact of piston and cylinder walls, is obtained. The clearance, however, is so small that a liquid seal results, and so positive is its action that after long service it is said to pull better than 29 inches of vacuum.

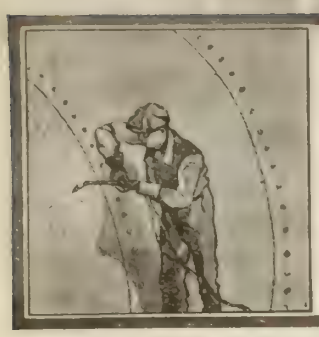
The piston check is the only moving part touching the cylinder wall, and this functions only at the point of transition at the end of the pumping suction movement or stroke to the beginning of a new stroke. The wear on this check is taken up automatically. While the piston is discharging, it is acquiring fresh liquid on the opposite or suction side, and the piston in the opposite chamber is functioning conversely, thus giving balanced action and continuous flow.

The head at one end of pump case is blind—that is, the shaft does not extend through. This eliminates packing. At the other end, a gland which holds the packing material is bolted to the head. This gland is separate from the bearing bushing. The gland is designed to act simply as a gland, and the bearing bushing to serve solely as a bearing.



The pump is very compact, light in weight and is said to be practically free from vibration. It is also self-lubricating.

Various accessories and variations from standard equipment can be attached, these including pressure gauge, air chamber, by-pass and relief valve, foot valve, strainer, flanged pipe connections, electric remote control, etc. One style will pump lubrictaing oils from the lightest to the heaviest, in fact the pump is said to be able to pump any liquid of a non-volatile nature that can be handled in metal. The other types are, of course, for varied purposes, but as stated before we have not the space to enter into detail.



### ELECTRIC SOLDERING IRON

The use of the electric soldering iron to manufacturers in general is too self-evident to require any comment, and a new type of such an iron has been offered to the trade by the Vimy Supply Co., 567 College St., Toronto, Ont.

This iron has been approved by the H.E.P.C. and Canadian Machinery has had an opportunity of handling one. It is very compact, has a push button control in the handle, and the copper bits are readily removed and new or larger bits inserted if required. This is accomplished by means of a suitable socket. The iron heats up very quickly, and the control button in handle regulates the heat. One button is painted red. By pushing this in the circuit is made through the element. With every iron is given a guarantee for one year, also a few hints to iron users in general that are well worth following out.

TWO EXAMPLES OF THE DRILL AND REAMER HOLDER IN USE

# WELDING AND CUTTING

# An Efficient Method of Welding Pressure Vessels

## The Aim is to Secure Better Rating on the Welding Of Such Vessels—Preparing the Work—Testing the Strength of the Tank—Pressure From 500 to 1,800 Pounds Applied

By ANDREW OLIVER.

ONE of the most important projects of the American Welding Society is that of securing a better rating on the welding of pressure vessels by the Boiler Code Committee of the A. S. M. E. In the Standard Oil Company plant at Whiting, Indiana, we have experimented with autogenous welding of all sorts of pressure vessels. Some of the most important work that we have done is shown in the photographs.

Figure 1 shows one of our tanks before welding. This is one of the first methods of preparing the work that we used. To the left of the tank is seen one of the ends all ready to be inserted. This flanged head was prepared in a manner similar to the standard boiler makers' practice. Then it was inverted and welded.

Figure 2 shows the result of this weld. Note that the head is perfectly flat. The principal problem was to find a means of testing the strength of the tank. We had only one set of pumps with pressure enough to make a reasonable test. The tank was filled with hot oil and pressure was applied to 500 pounds. The tank was then tested by hammering and showed no defect. The pressure was then increased to 1,000 pounds and a slight bulge was noticed. When the pressure was again increased to 1,500 pounds the tank bulged quite a bit more, but did not break. Further attempts at increasing the pressure resulted in stalling our hydraulic pump at 1,800 pounds without any noticeable effect on the tank. Before releasing the pressure this tank was tested by stout blows with heavy sledge hammers, and no leaks developed.

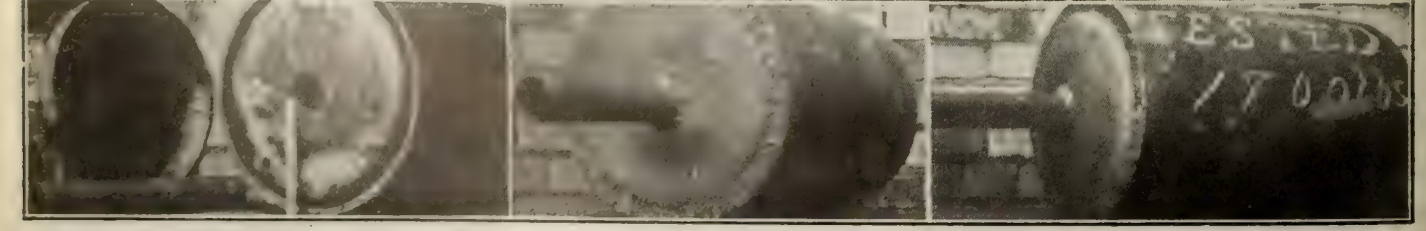
Another tank somewhat similar to this one is made of 15-inch extra heavy steel pipe, tested to 1,000 pounds per square inch and put in service under working pressure of 300 pounds. In service the heat has burned holes in these tanks, but no heads have blown out.

Our experience in pressure welding is not limited to these tanks. We keep ten or twelve locomotives in repair all the time and do a great deal of tube welding and we have had no failures of any consequence during the past six years. In the construction of stills we are now starting to increase the application of welding every week. Our former practice was to use a double row of rivets on these stills. In the future we plan to make a lap joint, insert a single row of rivets and then double weld them. At this point these questions were asked:

"In beveling these longitudinal seams, do you make a double 'V'?"

"No. We make a double bevel: that is, one side only is beveled to an angle of 45 degrees on each side of the seam."

"What is the reason for welding on the inside?"



"The weld on the inside is simply a wash weld to make the joints smooth."

"Do you make the entire outside weld first, then come back and weld it again on the inside?"

"Yes."

Since this first experiment many different types of pressure vessels have been welded in our shops. Figure 4 is diagram of one that we make in great numbers. This tank has to stand a working pressure of 100 pounds to the square inch and is constantly subjected to a temperature of 750 degrees Fahr. The tank is 44 inches long and 20 inches in diameter and is made of one-half inch plate throughout. The diagram shows clearly the difference in construction of the head. This difference in construction lowers the cost of material and of preparation, and this head stands as much pressure as the flanged head shown in the other illustrations. The heads are dished with a hammer and beveled with a torch. The side seam is beveled to a 45 degree angle with the torch before welding. When the oxy-acetylene process is used, the seam is welded both outside and inside. The head is inserted about half an inch below the head of the cylinder. This gives the welder a better chance to get at the work in such a way as to make sure of thorough penetration. The method of operation is to weld three or four inches lightly, fill to the top, and so on, to the end of the seam or weld.

After welding, these tanks are subjected to a pressure of 600 pounds per square inch with cold water and tested with a sledge. The first one of these

FROM LEFT TO RIGHT—FIGS. 1, 2, AND 3.—THESE VIEWS SHOW PREPARATION, COMPLETION, AND TESTING OF THE TANK.

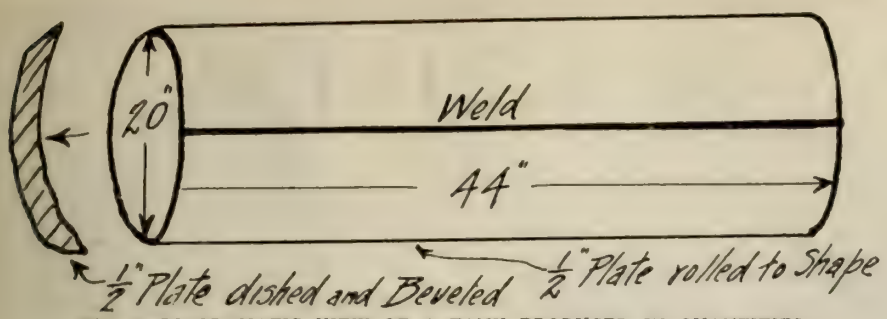


FIG. 4—DIAGRAMATIC VIEW OF A TANK PRODUCED IN QUANTITIES.

to be constructed in this manner has been in daily use for four years, subjected to both heat and pressure, and is still giving good service.

**Further Questions.**

Following this, several other questions were asked, and for convenience we will head the paragraphs Q. and A., these, of course, representing the questions and answers.

Q. Doesn't this, in the case of the oxy-acetylene weld, have a tendency to set up a strain?

A. This has never been noticed.

Q. How do you allow for the expansion and contraction?

A. When the welding is started, an opening of ⅝ inch for every foot of length of stem is left at the far end.

Q. How do you keep the crack open?

A. With a wedge.

Q. Will this spreading change the dimensions of the tank?

A. No; the weld contracts and closes the sheet to proper dimensions.

Q. Isn't it true that the greatest contraction occurs when the welder is working at the centre of the seam?

A. Yes.

A. Does the process (gas or electric) used make any difference in the amount of opening?

A. Yes, there is more radiation in gas welding, so, when using the electric arc process, not quite so much opening is required.

Q. Which process is used in making the tanks just described?

A. Both.

Q. How much reinforcement is made on the seam weld?

A. Just a trifle over the surface. The added metal is made to lap over about ⅛ inch on each side of the "V."

Q. Is it necessary to support the weld during the operation by placing a flat bar under the weld?

A. No.

A. How many amperes do you use, and what size wire when you make these welds with the arc?

A. Two hundred amperes of current. The first weld is made with 5/22 or 3/16 wire, then followed with a ¼-inch wire.

Q. What is the usual speed when welding the head?

A. Four to seven feet per hour with heavy wire.

Q. Is any attempt made to clean the electric welds?

A. Not to any extent. Any drops that are left by the arc can be chipped off with a chisel.

Q. Do you test your welders before starting them on this work?

A. Yes. The foreman keeps a careful check on the new men and makes sure they can do first-class work before giving them this kind of a job.

In connection with the discussion on the amount of opening to be provided before starting to weld, reference was made to the following extract from a paper, "Welding," read by Charles Hollup before the American Society of Refrigerating Engineers, Milwaukee, Wis., June 7, 1917:

**Longitudinal Seams.**

In welding longitudinal seams on round tanks, it is first necessary to have a perfectly round shell; that is, the joining ends of the sheet shall not have a flattened section, as customary when coming from the bending rolls. That flat and peaked-looking joint has a tendency of rounding out under pressure, and, in so doing, has a wedging action on the weld, which is often the cause of rupture. The edges of the seam should be beveled as in all other butt welds.

Before proceeding to weld a seam of this kind, expansion and contraction must be considered. These are vital points in welding, and only too often lost sight of. Starting on one edge of the seam, it is necessary to have the edges of the sheet on the far end spread apart. The object is to allow the molten metal, which is then at its most expanded state, to shrink and gradually bring the edges together as the weld is progressing, thereby avoiding shrinkage strains as much as possible. For the same reason I advocate that a seam of that kind should be made at one filling in if possible, or if the sheet is too thick that the heaviest fill be made while the other end is still open. The proper amount of this opening for acetylene welding should equal the thickness of the sheet per foot of length. In other words, a ¼-inch thick sheet 6 feet long should be 6 x ¼, or 1½ inches open on the far end. For electric arc welding about one-half of this is enough.

---

In preparation for the closing down of the plant due for May 1, the British American nickel plant at Deschanes is gradually reducing its staff. Last week about three hundred men were let go.

## Then They All Rush Together

WHY is it that it is easy to sell equipment to plants when they are booming along and making money, and why is it that much of this equipment arrives about the time the boom is over, when it is as good as useless for serving the purpose for which it was purchased?

The Federation of Engineering Societies, of which Herbert Hoover is president of the executive, is seeking a solution to this question, and a point is brought out in their findings that has been emphasized many times in the columns of Canadian Machinery:

> "Our studies of industries as a whole show that we usually expand our equipments just at the periods of maximum demand for their products, instead of doing our plant expansion during periods of slack consumption. That is one of the factors in our great unemployment problem to-day."

The trouble is that even in our industrial plants, in too many cases we are speculators rather than investors and builders for the future.

When we see things moving, our courage rises. When we see orders starting to come, we get ready to handle them. When we are swamped with business, out go orders for equipment that would have prevented the swamping.

It is a fact that in a season of high productivity, capital is easily interested in enterprises of various sorts. In the great majority of cases it is then, and only then, that the necessity for increased equipment most impresses men's minds, and it is the enthusiasm of these periods that brings expansion, and not the cool, deliberate planning and calculation of less prosperous periods.

The Federation of Engineering Societies may turn this question up on edge, and bore holes in it, but they will not settle it. In the smaller circle of men's lives, we never repair the furnace until the day we want to light it, nor do we think of sharpening the lawn mower until the grass is crowding six inches in height.

The price one pays for a piece of equipment is neither here nor there, if that equipment is going to earn its way when the call for production goes forth.

The trouble is that the request for equipment goes out after many other calls have gone out for similar machines. Then comes the shipping schedule, extending over five, six, or ten months, and in that time the "late-ordering" firm simply has to sit back and watch the business go by.

---

It might be well if some person with a faculty for turning out pointed phrases would come to the aid of the scrap metal trade. Dealers in recent months have called trade "rotten," "stagnant," "dead," "sluggish," "fierce," etc., with the result that it is now almost impossible to describe conditions without monotonous repetition.

## Relation of Prices to Sales

THE U.S. Steel Corporation is being rapped on the knuckles for not pruning its selling schedule and chances are, were the truth known, the same corporation is being entreated not to let its price list get out on the skids.

Were the Corporation to put up the argument that it cannot afford to lower prices, it would immediately meet with the statement that it can.

The National City Bank of New York seems to be of the opinion that the Steel Corporation should lead in the procession toward lower prices and states that "nobody thinks bottom prices have been reached."

Forbes' Magazine, in this connection, goes this far: "The judge's plea that a reduction in prices would not increase demand a single ton has evoked expressions of astonishment throughout the whole industrial and business world, so unsound and indefensible is his reasoning."

Not so fast, here. Can Forbes' Magazine trace the progress of the price slashing of the independents, and see their order books becoming more and more barren as the price cutting proceeded and yet come to any other conclusion than that stated by Judge Gary?

The experience of the steel market does not bear out the idea that cut prices bring in a greater tonnage to the books of the mills.

When a manufacturer wants steel he does not buy because it is cheap or expensive, but because he wants it. He is going to make something with it. If the steel market finds business coming its way on any other basis, it is something new to this paper.

It is a fact that Canadian warehouses are selling less bar mill material to-day around 4c per pound than they were a year ago at 5.75. Were they to drop prices over night to 3c per pound, we doubt very much if orders would start to come.

If low prices bring sales, what is wrong with the scrap metal situation? Go down to-day and you can almost name your own price. Values are away down and even steel mills and foundries are not buying, although they know that when things start to move prices are sure to stiffen.

It is easy to sell in a rising market. Under such conditions the big idea is to get under cover before the next rise comes.

It is equally hard to sell in a dropping or stagnant market.

In the main, we are very much inclined to believe that Judge Gary is quite right when he holds that a cut price brings no more tonnage to the steel mill or the blast furnaces.

---

A table of figures showing present and 1913 prices in British trade brings out the comparative value of 1913 with 1920 prices. Coal, as declared in 1913, was £6,000; in 1920, it would seem that imports must have increased because they are shown as $27,000, wherein, in reality, at 1913 values, the 1920 imports would show a value of £3,000.

# MARKET DEVELOPMENTS

## The Liquidating of Stock Takes up Attention

### Nothing Heard Definitely From the Steel Corporation About Change in Prices—Toronto Warehouses Anxious to Get Out of Certain Lines in Which They are Overstocked

THE work of liquidating stocks is being carried on, even to rather severe lengths, in a good many Canadian warehouses, carrying steel, iron, small tools, various lines of equipment, etc. The idea seems to be to get cleared out in order that they may take advantage of any new market standards that are coming out from time to time. It is a fact that a number of warehouses are right now acting as commission merchants, in that they find it possible, with factories making immediate deliveries, to send orders direct to the makers, instead of putting in stock for the purpose of filling them. It means that stocks in many lines are being reduced to the smallest possible margin, and that there must be considerable buying done for purposes of replenishment when the business tide turns toward a buying movement of any proportions.

The move toward lower prices seems to have been halted for the present, although some items have been marked down this week. In the steel market, prices are about where they were a week ago, although a number of them are subject to revision according to the size of the order in sight, and the urgency of the buyer for more favorable consideration. Then, again, there are lines which warehouses are rather eager to see move out, and if a buyer shows on the business horizon looking for these particular lines, he is almost certain to get a price well below market levels.

Buying is done in the machine tool market in small lots, and the demand for used equipment seems to occupy the first place in much of the trading.

The scrap metal market is still running in poor luck. Business is about as well fagged out as could be possible. Dealers are not taking on anything, and although prices are very low just now, the customers show no inclination to come out of their hiding, and cover their future requirements.

## COMPETITION IS KEEN—ORDERS COME ONLY AFTER KEEN BIDDING

Special to CANADIAN MACHINERY.

MONTREAL, April 7.—Industrial activity in this district still reflects the depression of trade generally, although nature has stepped in to remove some of the tension in the way of unemployment. The opening of the harbor and the work in connection with port developments has helped in reducing the ranks of those "out of work." Considerable replacement and improvement to the service is planned by the Montreal Tramways; this will mean work for several hundred men. The new Mount Royal Hotel, a large office building for the Canada Cement Co. and the new addition to the head office of the Sun Life Assurance Co. are a few of the large construction works that will be carried out this year. Operations will be resumed in the large railroad shops this week, but no assurance has been given of permanent work, owing to the light requirements for repairs and equipment. The metal situation continues quiet, with little movement, but prices are holding relatively firm, tin alone showing a slight decline, the current price being 36 cents per pound. There is a feeling that coppers will strengthen in the near future.

**Slight Improvement in Some Quarters**

There is an old saying that "coming events cast their shadows before." The remark of a steel dealer here, last week, was of such a cheering nature that it looks as if "the coming of sunshine dispels the gloom of the past." When asked regarding summer outlook, this dealer replied: "I do not mind telling you that our business during the past two weeks has shown gradual improvement. The previous week was the best we had experienced since the beginning of the year, and last week was even better. Friday's orders alone exceeded any two previous days this year. I would not care to say that this will continue but there is every indication that consumers are going from day to day with no more than they actually need. We were asked the other day for some cold drawn stock of a certain size. The customer took the few bars we had on hand, requested immediate shipment of some we had on order, and further instructed us to deliver 125 bars as soon as possible. Much of our business of late has been due to 'rush' wires, showing that the need is urgent."

What tends to substantiate the statement that increased activity is taking place in the automobile industry is the greater inquiry and demand for cars in many quarters. Officials of the automobile association in this district intimate that greater interest is being taken this year than last, and this is reflected in the larger sales of nearly every make of car. This is a development that, in itself, may have no great effect upon the steel operations, but the improvement in motor activity will indirectly affect other lines of enterprise. The rumored revision of prices by the United States Steel Corporation, to take effect later in the month, has created a feeling of expectancy in many quarters, and has likewise caused some exhibition of nervousness. It is thought that this has been timed to coincide with the action of the railroads, in their attitude towards labor, as it is generally recognized that the wage question must be adjusted before normal industrial activity can be resumed. The steel situation here is unchanged generally, but with some dealers reporting slight improvement, consumers buying conservatively. No

nual statement for wiping some of this material out, and it has been moving now. The result is that the customers are getting good close prices, and the warehouse is being enabled to get rid of material without liquidating at a loss. One sign that the smaller shops are doing some buying is the increase in the call for carbon drills. In the larger shops high speed steel is called for almost entirely.

### In the Steel Market

"Looking back over the business of the month of March, we found that sheets had been about the best selling line we had," stated one steel merchant. "This refers to both black and galvanized. A number of industries contributed to this result." The movement in sheets is helping warehouses to get rid of their stocks, which are still fairly heavy, but well assorted.

The total volume of business done in tubes for the first quarter of 1921 has been disappointingly small in many cases, but the season should still be good. Buying is being done on a very small basis. There are cases, some of which we heard about in the market this week, where several large boilers should be attended to, but the proprietors are holding back hoping for a better price, which, considering the amount of tubing in a good-sized boiler, would amount to quite an item.

This week has its fresh crop of rumors about prices on steel being raided by a new price to be brought out by the Steel Corporation. Rumors have been so numerous of late that the chances are that they have little bearing on the market. Neither warehouses nor manufacturers have been buying freely. The general feeling is that the Steel Corporation is the only agency that can stabilize the steel market, and until some move is made by the Corporation, affairs in the steel world will be more or less uncertain.

There seems to be a tendency on the part of dealers to hold prices up pretty well to their schedule. This depends largely on whether there is a desire to get rid of a line, or whether they can afford to carry it along. For instance, iron bars are quoted around 4.25, while some sales are being put through at 4c. Where a warehouse is heavily stocked in a line that he is not desirous of retaining at the present tonnage, one might get a figure as low as 3.75, but that would not represent the market. The bulk of the sales are being made between 4c and 4.25c.

### Selling Small Tools

Small orders for small tools seems to describe the situation, if one is to accept all the stories of the dealers who are out scouring the markets for orders. Complaint is also made that selling schedules are being pruned at all corners in order to secure orders.

Dealers in the scrap metal business have plenty of time to discuss the situation in their field just now, for they have little else to do. There is nothing to show any improvement in their lines. Yards generally are loaded with copper to such an extent that they will be busy getting out from under as best they can for some time. The small dealer is more or less out of the running entirely, especially the man who goes around the country doing his own collecting. Prices are all against him, and he is sorely tempted to drop out until things turn for the better.

# PITTSBURG BELIEVES THE STEEL BREAK HAS ALREADY SEEN ITS CLIMAX

Special to CANADIAN MACHINERY.

PITTSBURGH, April 7.—The iron and steel situation is now clearly defined. Any doubt there may have been as to the nearby future of the trade is resolved, as there has been buying in the past few weeks and the character of the buying is well established. When there was a complete absence of demand there was naturally doubt as to what would be the character of the demand when any developed.

Practically the universal experience of the steel producers is that of doing a carload business. That is true of the Steel Corporation quite largely when it receives releases on orders previously held up, though the Corporation does receive some releases of larger volume, and it is the usual experience of the independents when receiving new orders. It is only occasionally that a good sized order is placed, this being for some piece of construction work. The regular manufacturing consumers, as well as the jobbers, are calling for material in carload lots. In many cases the specifications show that the material called for is required to piece out on stocks already in hand. Some jobbers and manufacturing consumers have gotten to the point where they need to take steel in general, but in most cases it is a matter of rounding out stocks, which have been getting ragged.

There is nothing that can be called a "spring demand" and that is distinctly disappointing. There was no occasion for disappointment in January, when predictions made in December that there would be a revival in demand after the turn of the year failed of verification, for such predictions had not been well founded. January is not a month in which steel demand normally increases. March is such a month. The rate of steel consumption at the beginning of April does not appear to be larger than the rate at the beginning of January, and probably it is less. It is true that some industries are more active, much stress being laid upon this fact in various reports, but on the other hand many industries are less active, and not much is said about that.

### Steel Prices

There is no deadlock on steel prices. Buyers give no intimation that there is any price at which they would really take hold. If there were any large demand to be developed by reducing prices the United States Steel Corporation would undoubtedly make the reductions it is certain to make eventually. The majority of the Steel Corporation's customers seem to be well satisfied with the Corporation's policy of holding to the Industrial Board schedule, and they could hold this view for no other reason than from having stocks of raw or manufactured material they wish to liquidate on the best terms possible. Of course those who are in the market to make fresh purchases secure the lowest quotations obtainable, but their buying is of small volume. While the total quantity of material now being specified is small, the probability is that the bulk of it is in the form of specifications against old contracts or releases for shipment against orders previously held up. In the case of the Steel Corporation this business is, of course, at the regular Corporation or Industrial Board prices, while in the case of the independents there are probably adjustments to the existing independent market as commonly quoted.

Bars remain quotable at 2c for carload lots with desirable specifications, shapes and plates being correspondingly 2.10c. These prices were possible a month ago, but concessions obtainable on large lots are probably smaller now than then. Seeing that it is two months since the independent market broke, and there has been no actual decline in these three important commodities for a month, it is plain that the break is over. The independent market is more or less stabilized, and the next important development will probably be the Steel Corporation's reduction, which may occur very soon or not for several months. While it is always somewhat dangerous to prophesy, there is reason for making this prediction. With their very light operation the independents have high costs, much higher than they would have with the same wage rates and raw material costs. They could reduce their production costs by having a larger operation, and that would be an incentive to cut prices further, but if much more business were to be obtained by making prices the Steel Corporation would be influenced by the condition as well, and would reduce its prices. Hence it seems reasonable to conclude that the independents are unlikely to reduce their prices much if at all until the time comes for the Steel Corporation to make its reduction. The common view is that when the Cor-

price changes are recorded and those quoted are more or less nominal. The surcharge on freight shipments for the current period is slightly improved, it being 8 per cent. in place of 9 per cent., the new rate being effective on April 1.

Commenting on conditions here as compared to those in the States, a business man associated with the machine tool activity stated last week that he believed that Canada was better off, just now, than any other country in the world. Industrial conditions in the States are much worse than here and the outlook for the summer is still uncertain. Another dealer remarked that business had been better, especially in contractors' supplies for construction work. Metal working machine tools were not in heavy demand, and supply requirements of the smaller order had been light. "It is a market where competition is pronounced," said a salesman, "if you keep everlastingly at it you will get results, but you have to be prepared to 'meet the other fellow.' Just last week we had an inquiry for some material made in Hamilton, for which we were quoting 6½ cents; Toronto was asking 6¼ cents. We closed at 6¼." Consumers and users of tools are keenly alive to the situation and endeavor and usually succeed in getting the very best price.

### No Scrap Export Now

The war has effected some surprising changes in business conditions, and not the least of these is that shown in the movement of old materials. When asked what influence the opening of navigation would have on the scrap market, one dealer here replied: "Very little. Before the war we did considerable business shipping scrap overseas, but this is now only a memory. The accumulation of scrap in England and Europe is past calculation and it will take years before conditions get back to what they were, and there is a possibility that this time may never come, owing to the complete change of the industrial outlook. Come down in the basement and I'll show you something." He escorted me to the cellar and confronted me with a pile of copper bands that had been made for 8 and 9-inch shells, but which had never been used. At a rough estimate there was upwards of 50 tons in this pile and he said there was more. The price paid for these bands was in excess of what could be realized on the market to-day. The continued dullness in steel activity has resulted in a further softening of prices and quotations on heavy melting steel and old rails have been marked down from $15 to $12 per ton. Machine shop turnings are now quoted at $6, a decline of $2 per ton. Other steel scraps are unchanged but nominal. Non-ferrous scraps are moving lightly with prices easier. Coppers are showing weakness, crucible declining ½ cent to 11 cents per pound. Heavy lead is likewise quoted ½ cents off at 4 cents per pound.

## POINTS IN WEEK'S MARKETING NOTES

**New York expected a couple of weeks ago that a buying movement was fairly well under way, but it has fallen off sharply since.**

—

**Export trade in machine tools for United States builders continues to be very dull. Japan navy and arsenal have been doing some buying.**

—

**Announcements of reductions this week come from a maker of planers and another from a radial drill firm. Chain blocks are also marked down about 15 per cent.**

—

**Pittsburgh goes as far as to claim that the break in the price of steel is over, although the announcement of the Corporation on its prices is yet to come. Others hold that it will call for a cut in prices and in wages at the same time.**

—

**Selling out present stock is the one big idea of a good many of the warehouses in Toronto. Sizes not required are being let go at a close figure.**

—

**Dealers claim that a fair amount of business is now coming from small shops that have not been buying anything for a long time because travellers had been passing them by.**

—

**Small tools, particularly drills and in some cases files, are being sold at close figures, and complaint is being made that makers are selling at closer prices than the jobbers.**

—

**The scrap metal market has few bright spots. Dealers are waiting for the turn, welcoming anything that comes, in the belief that it cannot be worse, and therefore must be for the better.**

## MOVING STOCKS THE PROBLEM

**Warehouses for the Present Prefer to Send Orders Direct to the Manufacturer**

TORONTO.—One of the outstanding features of the market in this district, especially in iron, steel and many lines of tools, is the feeling that prices quoted in the various lines are not stable enough to warrant much business being placed on the strength of them.

Several of the machine tool men claimed that during the month of March there had been a slight improvement in the general tone of business, and when the figures for the month had been totalled up, it was found there had been a very fair volume of trade.

Firms handling used equipment as well as new seem to be having the edge on the others in securing the volume of trade just now. There continues to be a demand for used material, and there is still a large amount of this available. Several of the war shops were never entirely cleared out, and steps are being taken now to dispose of equipment in these.

### Thinning Out the Stock

Getting rid of the stock seems to be the problem of warehouses in many lines of business, in fact those that have anything they are not willing to talk price on are very much in the minority at the moment. The manager of a large selling agency in Toronto showed a representative of this paper through a number of the departments of that business. In many departments one could see the red tags on the bins, which would, under ordinary circumstances, mean that their supply had run out of that particular line, and orders should be placed at once for sufficient to last from three to six months. Just now the firm seems to be particularly pleased with the increase in these red tags, as they are not placing orders as soon as a red tag shows up.

Speaking to Canadian Machinery of their present selling and buying policy, the manager stated: "We find that we can get along for the present without putting in large stocks. When we got on the basis of sufficient for a month only, we found that by the time the shipment would come in there would be an accumulation of orders, and the stock seemed to come in and get right out again. Then there are other lines where we can get very ready service from the manufacturers. Orders can be sent along from our customers, and until prices get a little more stabilized it is just as satisfactory for us to send orders direct to the makers, and have shipments made from there to our direction. We are busy getting rid of stock, not taking more on."

This is true of several lines of business, and while for the present it does not mean large buying, it does mean that stocks all over are running very low, and when demand quickens there will be very heavy buying done.

### Changes in Demand

Another very odd thing has come to light within recent weeks, viz., that several lines are being moved which have been standing still for a long time, in some cases for years. In some cases salesmen are calling on shops again which they have missed for a long time. They were not in the war work rush, and only recently have salesmen, in their chase for orders, looked them up. Their buying is not large, but it has called for some lines that have been standing still. In one place, we know that a certain amount has been written off in the an-

poration acts on prices it will endeavor to make one reduction that will cover the whole ground.

The market on standard steel pipe has become decidedly irregular, following the slight shading reported a week ago. Extra concessions of 2½ or 5 per cent. that were formerly given only to the very largest trade are now more or less common property with carload buyers, and, of course, there is ground for supposing that the large buyers could get extra concessions. Line pipe, which has been shaded for quite a while, is going at closer and closer figures as inquiries develop.

The sheet market is lower by about $2 a ton on black and $4 on galvanized, at 3.75c for black and 4.80c for galvanized. These prices can be done on carload lots if the specifications are attractive. On large lots the concessions from the carload price are less than when the carload market was higher, and it is not altogether certain that any concessions could be secured, except on the heavy gauges of galvanized, the difference in production cost between heavy gauge and 28 gauge being greater than the gauge differentials in the standard list.

### Coke Developments

The coke market at last shows approximately where it stands, a sale of 500 tons a day for five or six weeks having been made by one of the largest operators to the furnace at Portsmouth, O., which is to go into blast and needs Connellsville coke for a while, until it gets its by-product coke plant in operation. The old claim was that it cost $5 a ton to make furnace coke. A few weeks ago one of the large operators made a wage reduction, announced to average 18 per cent., and some other operators made reductions. About a fortnight ago it became known that some other operators intended to reduce wages and some of those who had made reductions intended to make a further reduction. Apparently at the last moment word went around and practically all the independent operators announced the restoration of the scale of November 10, 1917, effective April 1. This seems to make the wage rate uniform, except that the H. C. Frick Coke Company (Steel Corporation) has taken no action, its intention evidently being to act when the Steel Corporation makes its general wage reduction at the furnaces and mills.

The independent scale now in force is approximately 30 per cent. below the old scale, which went into effect last year, and of course materially reduces the cost of production, this accounting for the $3.75 sale reported above, which is the most important business done since it became settled that the 1917 wage scale was to be restored. Foundry coke for spot shipment remains quotable at $5 to $6, according to brand, but is likely to settle some in sympathy with furnace coke.

Pig iron remains quotable at $25, valley, for Bessemer, foundry and malleable and $23 for basic. These prices could possibly be shaded a trifle on inquiry for a fair-sized lot.

## THE NEW YORK MARKET SPOTTY

**Hopes of a Revival in Machine Tool Circles Prove To Be Rather Short Lived**

Special to CANADIAN MACHINERY.

NEW YORK, April 7.—Hopes which the machine tool trade entertained about two weeks ago of a moderate resumption of buying have apparently gone a-glimmering, for the moment, at least. The past week has been exceedingly dull locally. Some of the companies which have come into the market for shop equipment appear to be in no hurry to buy, and wherever possible are scaling down their estimated requirements. For example, the General Electric Co., which inquired a few weeks ago for about 30 machines for its Schenectady shops, found that by moving machines from one department to another it could eliminate many of the items on its list. The American Sugar Refining Co., which inquired for about 50 tools for its Baltimore refinery repair shop, has bought a few fabricating machines and pipe machines, but the rest of the list being held up, temporarily at least. Nor have orders been received here from the Batavia Car Works, Batavia, N.Y., which issued a list of about 25 machines a few weeks ago.

Railroad inquiries, which have covered only a few machines in each instance, are mostly being held up, but the Bangor & Aroostook Railroad bought a 600-ton car wheel lathe. The list of the Virginian Railroad, comprising about ten or twelve machines, is being held up indefinitely.

The Western Electric Co. has been a fairly consistent buyer of late, both for its domestic plants and for its plant in Japan. The Japanese Government, which has already bought a considerable number of machines for its navy, is also reported about to buy for its arsenals. On the whole, export trade continues very dull.

The Singer Manufacturing Co., New York, manufacturer of sewing machines, is in the market for locomotive cranes, travelling cranes and machine shop equipment for a plant in Canada. Little is known here as to its exact requirements, it being stated that the equipment will be purchased in Canada.

Further price reductions are announced. A leading manufacturer of planers has reduced about 10 per cent. and radial drills have been cut a like amount.

## Pig Iron Market

In most centres pig iron sellers have been able to check the downward trend of prices on moderate tonnages, but further weakness has developed at Cleveland and Chicago.

The little spurt of activity of a week ago has subsided as quickly as it developed. A fair number of small lot orders for foundry iron for prompt shipment have been placed generally at $25, valley furnace, for No. 2 grade. Some makers of this grade are not disposed to go below $26, but the willingness of others to accept business at $25 makes it difficult to sell at a higher figure.

The pig iron market at Chicago still lacks stability, but the downward trend of prices is less marked than heretofore, possibly because producers are getting down to bed rock costs.

An increasing number of melters in the New York district, who have refrained for a long time from buying, are being compelled to come into the market, and are placing orders for early delivery. This does not mean heavy buying, but a little improvement over recent extreme dullness can be noted.

The situation in New England in foundry pig iron is somewhat clarified by cash readjustment on contracts, a general practice of late. There is a better demand and slightly less than 1,000 tons reported as being sold the past week.

Foundries generally are melting somewhat more iron than they have been and the Belleville, Ill., stove foundries have opened up on orders received, while the St. Louis stock foundries report that new orders are coming in and causing interest in pig iron to meet the contracts that are in prospect.

Philadelphia reports that although the foundry iron market had settled to a basis of $25 furnace on any attractive orders, most of the business taken in the past week has been nearer $26 furnace. The Brooke furnace will go out of blast within a week or ten days, leaving only two regular merchant furnaces, Warwick and Swede, in blast in eastern Pennsylvania.

### CHINA LOOKING TO THE FUTURE

The Government of the Chinese Republic has inaugurated a Bureau of Economic Information for the dissemination of information relative to economic, commercial, financial and industrial development within the boundaries of the Republic of China. This information is being published semi-monthly, in pamphlet form, the first of the series showing the date of January 25th, 1921. Communications from outside countries should be addressed to Government Bureau of Economic Information, Box 653, American Post Office, Shanghai, China.

# India As a Market For Canadian Iron and Steel

## Some Canadian Steel Lines Have Been Fairly Well Established in Those Markets—Greater Care is Necessary in Packing And Studying the Likes and Preferences of the Buyers There

THE markets of India as a possibility for Canadian iron and steel goods is dealt with at length by H. R. Poussette, director of the Canadian Commercial Intelligence Service. Where reference is made to money it should be noted that the nominal value of the rupee is now two shillings or one-tenth of the gold contents of a sovereign. Its actual present value is about 1s. 4d. to 1s. 5d.; just over a year ago it was 2s. 10d. A lac of rupees is 100,000 rupees, and is written 1,00,000; a crore equals 100 lacs. In India the rupee is divided into 16 annas, and the annas are further subdivided into 4 pice. In Ceylon the rupee is divided decimally.

Iron and steel in various forms is imported into India in exceedingly large quantities, as a reference to statistics will show. At the present time there are three producing companies organized in India; the Tata Iron and Steel Company, a very important concern which manufacture at Jamshedpur, about 150 miles west of Calcutta; the Bengal Iron Company, which make iron, ferro-manganese and iron products at Kulti, some 140 miles from Calcutta on the East Indian railway; and the Indian Iron and Steel Company, which it is expected will commence manufacturing pig-iron about the middle of 1921.

India contains fairly large quantities of coal, mostly situated in the provinces of Bengal and Bihar, and deposits of iron ore, which are said to be almost inexhaustible, are found in Singhbhum district, Chota Nagpur, and in which very large claims have been staked out by the three Indian companies already mentioned. The iron ore is said in certain locations to have a depth of from 2,000 to 3,000 feet, part of which is below and part above sea level.

### Iron and Steel Products

Very little is heard of Canadian steel in this market, although a certain amount has found its way to India. One firm in Madras stated that they were importing both iron and steel from Canada, and this was one of the few instances where mention was made of Canada in this connection. Considering the huge business which the United States have worked up in India in iron and steel products, there seems no reason why the Dominion, particularly now that direct steamship connections have been established, should not be able to do a considerable amount of business in this market. The imports of steel angles and springs in the fiscal year 1919-20 amounted to over Rs. 52 lacs, and the imports of steel bars and channels to over Rs. 2 crores, of which the United States exported no less than Rs. 1,08,00,000, or about £1,000,000. Of the total of bars and channels imported, the United Kingdom supplied to a value of about Rs. 74 lacs. The trade for April and May, 1920—the first two months of the financial year—amounted to 28,421 tons, of which the United Kingdom supplied 18,000 and the United States about 4,500 tons.

Canada has competed in Japan and China in steel bars, and is possibly doing so today; accordingly our steel mills should be able to do equally well in India. It is very likely that the supplies sent into this country will continue to be heavy if not to expand over a number of years. One firm stated that if they could be assured of receiving supplies from the Dominion they would be prepared to take 30,000 tons of mild steel a year, spread over girders, bars, angles, tees, rods, plates and sheets. Importers stated that there is a very good market for tool steel in squares, rounds, flats, hexagonals and octagonals, ¼ inch to 3 inches. There is a certain amount of faggot steel imported into Burma, and possibly into other parts of India. In the former country these are manufactured into big knives called dahs, which are almost always carried by the jungle natives. These knives are also made of bar iron and edged with Milano steel.

In connection with the steel business, it should be mentioned that a good deal of it is done on a consignment basis—in fact, the head of a very large importing house stated that practically all British steel manufacturers do a consignment business in India, and the same remark applies to wire rope.

American steel manufacturers appear to be very determined to make themselves supreme in the Indian market, and some of them have opened up their own offices. It is understood that the largest of these will carry heavy stocks, and supply their customers from their own godowns, as is their practice in other parts of the world. This is undoubtedly a sound as well as an aggressive policy, and one that will probably be very well rewarded in the future.

### Canadian Wire There

Canadian wire is well known in this market, but appears to be considered by dealers to be somewhat dull in appearance. One large importer stated that the pre-war German wire was the very best he had ever handled, but in his opinion the article turned out in the United States today is exceedingly satisfactory, and one point upon which he was very strong was that the packing of the latter was the best in the world.

It is pleasing to note that Canadian woven wire fencing has firmly established itself on this market, and is probably more used than the make of any other country, although very few in India are aware of the fact. There is a certain, but by no means extensive, demand for wrought iron gates. One dealer was very interested in a gate which he had seen in Canada, which opened automatically on approach, and was anxious to obtain one.

Wire netting, which should be painted green, is in considerable request. This is imported from the United States in 12, 14, 16 and 18 mesh, 3 feet wide, and in rolls of 50 feet, and also 8 by 8 to the inch—which latter is used for rice mills. On tea estates a good deal of 19 gauge wire netting is employed in the withering houses, ½ and ¾ mesh and 3 feet wide.

### Bolts and Nuts

Bolts and nuts are made in India near Calcutta, but as the figures show, this local industry is not able by any means to supply the requirements. The imports for the fiscal year 1919-20 amounted to nearly Rs. 26 lacs, of which the United Kingdom supplied to the value of about Rs. 14 lacs, the United States about Rs. 10 lacs, and Japan a little over a lac. It is interesting to note how the trade of the United Kingdom jumped up in the year referred to, while that of the United States and Japan, and particularly the latter, fell away. Apparently Canadian bolts and nuts have come into this market, as one dealer stated that he had handled them, and that they were quite satisfactory. He mentioned that the packages were a little short in weight, being 112 pounds gross instead of 110 pounds net, the latter being the weight to which the Indian market is accustomed.

### Must Please the Eye

Canadian nails are very well known but are not thought so well finished or well polished as the American, which in a market like India, where appearances count for so much, militates against their sale. Very large stocks of wire nails are carried by the principal importers, and one of them pointed out in his godown no less than 12,000 kegs. Unfortunately several shipments of Canadian nails arrived here some time ago, and, owing probably to mishandling in transhipment, the kegs on arrival in Calcutta went to pieces. The consequence of this was that the importers suffered a considerable loss, one of them putting it as high as 50 per cent., although that is probably somewhat exaggerated. With regard to the appearance, the difficulty does not lie so much with the ultimate consumer as with the bazaar merchants, who profess fear that if the nails are not

bright their customers will not take them off their hands.

There is a good market for nails for horse shoes and also for bullock shoes between 1¼ to 1½ inches.

All wire nails arrive on the market packed in kegs containing 100 pounds net, but it was stated by one or two importers that there seems no reason why they should not come out in cases of 45 to 50 pounds. Referring to American packing, one importer drew attention to some kegs of American nails to prove his point as to the excellence of their method. These kegs had wire hoops at the top and bottom, and other hoops four inches from each end. The ends of the wire were firmly twisted together and the hoops, which were fixed with staples driven in at intervals, had apparently been hammered over the ends of the keg. The breakages among American kegs are said to average not more than 1 per cent. Apparently the bazaar prefers wire nails with chequered heads.

## Scrap Metal Market

On the Pittsburgh scrap market prices continue to seek lower levels, due to the fact that few of the steel manufacturers are showing any interest in the market, and as the dealers who have yards see no immediate prospect of an improvement in business, they are reducing their bids against material for laying down on their yards. Heavy melting steel has been offered at $13.50 per gross ton delivered.

Prices on most grades have again dropped from 50 cents to $1 per ton on the Chicago market. Buying is at a standstill as both sellers and users are inactive. Railroad lists are also not attractive to carriers.

The chief activity at New York on the scrap market is in turnings, but these have declined $1, $9 delivered Phoenixville being about the best price obtainable.

There is a little activity in stove plate, cast and heavy melting steel on the Buffalo market, but not to be compared with a normal market. A tonnage of stove plate was recently bought at $19, but this was a top price. Ten dollars is the top price offered by a local consumer, which is not getting any heavy tonnage at this price.

The scrap market continues to be almost lifeless at Cleveland. A local mill is offering $13 for select heavy melting steel scrap to lay down in its yard, but with this exception consumers are staying out of the market. The supply is becoming somewhat more plentiful owing to the resumption of a few Cleveland plants making automobile parts, and this is having a tendency to make prices weaker. Dealers are showing some anxiety to the attitude of mills over the acceptance of high-priced scrap, a great deal of which they have on their order books at prices up to $30 or higher for heavy melting steel.

### POINTS FOR TWIST DRILL USERS

If the drill chips on the edge it indicates that the lip clearance is too great and fails to support the cutting edge. This may be because the drill is too hard. It is advisable to ease off on the feed and watch the grinding.

If it splits in the web, it is either ground with improper centre lip angle or the feed is altogether too heavy. The centre lip should be at about 45 degrees to the cutting lips of the drill. The drill is in best condition when the chip comes out in a close coil.

If the outer corners wear it shows that the speed is too high and it should be reduced. This is particularly noticeable in drilling cast iron.

Drilling cast iron can be done at a little faster speed than for steel, but the corners must be watched.

Right on the Lead

# A Big Job
# And A Big Die Head To Cut The Thread

In less than one minute's time the big 5⅜-inch Geometric Die Head cuts the thread on the bearing plate of ball-bearing journal jacks, and then releases automatically and makes way for the next tool.

The Foreman of Tool Supply in that Shop says he knows of no other tool that will do the work as they require it done like a GEOMETRIC.

Geometric Screw-cutting Tools help the man at the Lathe and at the Screw Machine give the best possible showing on a day's work. These tools are built to fit the work —to handle it in the easiest manner and produce threads that are true in every particular.

**100 PER CENT. SATISFACTION**
**IS OBTAINED BY THE USE OF A GEOMETRIC.**

## EXPECT TO GET ENGLISH ORDER

**Canadian Car Co. Officials Are Off To England To Secure Order For Canadian Shop**

Montreal—Negotiations for a large order for railway equipment have practically been completed in England with W. W. Butler, of the Canadian Car and Foundry Co., and W. H. Woodin, of the American Car Company, who have sailed for England to close the contracts.

Canadian railways, although short of equipment, have not ordered any new equipment recently, and a substantial Government order, which the Canadian Car Company has been expecting, has not materialized. Every effort, therefore, is being made by the car officials to book export business.

### Will Press Claim

Although little has been heard regarding the progress being made in connection with the company's claim for $6,000,000 of alien enemy money held by the United States Government to reimburse the company for the destruction of its Kingsland, N.J., shell plant during the war period, it is learned that the company is still pressing the claim and the consensus of opinion is that the verdict will be satisfactory.

### Work of Spies

It will be recalled that when the United States entered the war, the Washington authorities seized many millions in cash and property from German-Americans, and decided to employ whatever part of this was necessary to reimburse allied concerns for damage as the result of plots by spies and German agents. When Canadian Car's New Jersey plant was destroyed with tremendous loss proof was forthcoming that the explosion was the work of spies employed by the Germans and on this evidence the company is basing its claim.

### WHO WROTE IT?

On page 36, March 24th issue, we published a panel on cutting piston rings. This was credited to G. H. Unfortunately we lost the original name of the author. Will he kindly write us at once so that this matter can be straightened up?—Editor.

### TRADE GOSSIP

A factory for the manufacture of tins will be built by the Laing Produce & Storage Co., Ltd., Brockville, Ont.

The Canada Overseas Trading Co., Vancouver, B.C., has secured an order for 8,000,000 feet of ties for the Egyptian State Railway.

The erection of a refrigerator building is contemplated by Trottier & Mainville, 1091 Dorchester Street East, Montreal.

J. B. Nicholson, Ltd., Toronto, have been awarded general contract for the reconstruction of coal yard for Milnes Coal Co., foot of Church Street, Toronto.

The general contract for construction of coal-handling plant for Bridgeburg Coal Co. is placed with J. B. Nicholson, Ltd., Excelsior Life Building, Toronto.

The Princess Hotel at the corner of King and Princess Streets, Toronto, has been purchased by the Florentine Statuary Co. and will be converted into a factory.

J. B. Nicholson, Ltd., Excelsior Life Building, Toronto, has been awarded the general contract for the construction of grain elevator and workhouse for the Dominion Flour Mills, Ltd., Brantford, Ont.

Tenders are being called for new Y.M.C.A. building at the corner of Queen and Weber Streets, Kitchener, Ont. Plans and specifications for all trades may be secured on application at Y.M.C.A.

The Sterling Woodworking & Construction Co., St. Lambert, Que., whose premises were destroyed by fire in November, 1920, have nearly completed rebuilding, and the factory is now in operation. Sashes, doors, interior finish and general millwork will be manufactured by this firm.

### FIRES

Fire swept the business section of Capreol, causing a loss of $45,000 to $50,000.

The high school at Cayuga, Ont., was recently destroyed by fire. The loss is estimated at $30,000, with insurance of $10,000.

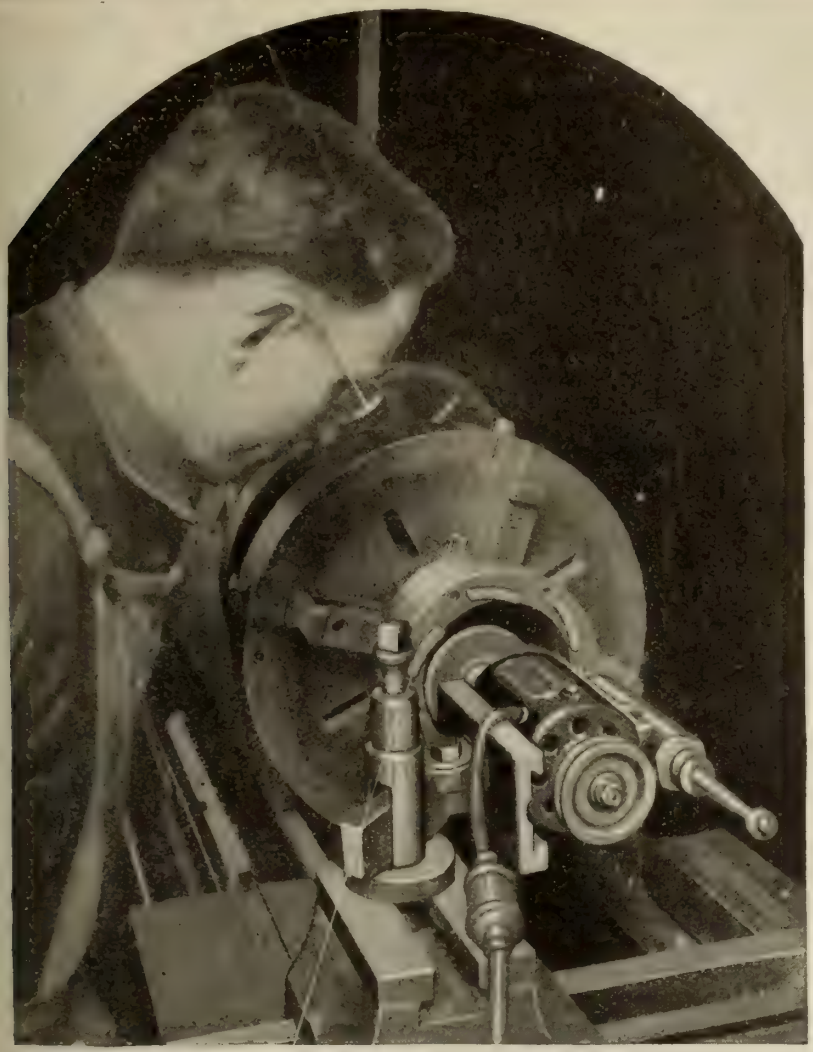
Fire destroyed the factory of the Johnson Rubber Goods Co. on Creighton Avenue, Mount Dennis, Ont. The loss is estimated at $15,000.

## STEEL OF CANADA ANNUAL REPORT

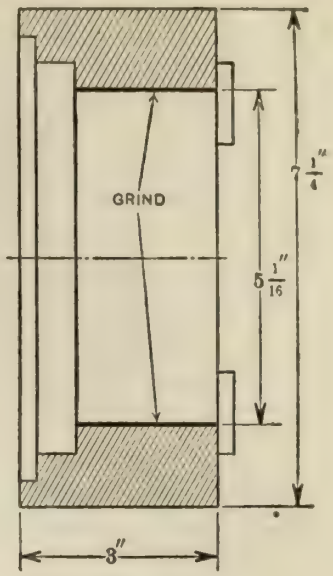
**Very Satisfactory Operations Were Carried On During the Year 1920**

A satisfactory showing, despite th many adverse factors which prevaile during 1920, is made by the report of th Steel Company of Canada for that pe iod which was made public. The e hibit shows gross profits well up to tho of the 1919 level. After deductin charges for repairs, maintenance, in provements and making provision f inventory, reserve and 1920 income ta the results of the twelve months' oper tions amounted to $3,924,041, as con pared with $4,000,940 in 1919 and $5 367,120 in the preceding year.

From the 1920 gross figures were d ducted an amount of $652,255 as a pr vision for excess costs of constructi due to the abnormal conditions existi during the year, as well as an allowan of $712,683 for depreciation. These pr visions, together with sinking fund r quirements and fixed charges, left n earnings of $1,855,404, against $2,382,1 in 1919, the latter year's showing in th respect being enhanced by the fact th no allowance was made for the writi off of any allowance for excessive buil ing costs.



**Earning Capacity of 11.7 Per Cent.**



After the payment of dividends on t preferred stock of the company the was left available for application to t common shares a balance of $1,400,6 which, however, was reduced by $50,0 transferred to fire insurance reser leaving the net sum of $1,350,663, rep senting an earning capacity of 11.7 p cent. on the junior securities, compar with 14.6 per cent. in 1919, 15.8 per ce in 1918 and 19.5 per cent. in 1917.

The Record Foundry & Machine C Moncton, B.C., was destroyed by fire March 28. The damage to the wa house and shops is set at $70,000, fu covered by insurance.

### WANTS TO KNOW

A correspondent writes for informati on the subject of flour grinding ro Who can supply us with some inforn tion on this subject?

CAM
FOR DIE HEAD

Attached to the toolpost of the engine lathe on which this cam has been machined, the Dumore Grinder accurately grinds the hole without necessitating another "set up." The high efficiency standards of the Geometric Tool Co. (New Haven Conn.) make comment unnecessary on this method of handling the job. It is sufficient that the work of the Dumore is so satisfactory, the finish so fine, that all cams this size or larger, made in this shop are ground in this manner.

## The Average Shop Has Constant Use for Dumore Grinders

Dumore Grinders are made in types and sizes that can be attached to all classes of machines and used to successfully perform a wide variety of grinding operations.

Equally valuable for the important "odd jobs" that must be done in every shop and on some manufacturing work, they find a ready place in every part of every metal working plant—whether toolroom, factory or repair shop.

***Ask us about DUMORE Grinders—full details on request.***

## Wisconsin Electric Company

**2933 Sixteenth Street** **Racine, Wisconsin**

# DUMORE HIGH SPEED GRINDERS

*If interested tear out this page and place with letters to be answered.*

## TRADE GOSSIP

**C. M. C. New Office.**—Canada Machinery Corporation has moved its Toronto sales office from Brock Avenue subway to rooms 721-2, Bank of Hamilton Building, the new phone number being Main 745. W. J. Irving is in charge of the office, and J. W. Brown continues with the sales force here.

**Bought Premises.**—The British Canadian Tool and Machine Co., Ltd., Toronto, have purchased the property at 506 to 516 King Street East from the King Street Mission for $23,000. The lot has a frontage of 100 feet by a depth of 200 feet. This property was bought by the mission in 1912 with the idea of erecting a new building. The property is opposite the old car barns. The purchasers are erecting a $40,000 factory.

**Two Cuts Coming?**—It has been reported in New York that a cut by the United States Steel Corporation, in prices as well as wages, would be announced on the return of E. H. Gary from his western trip, probably on Thursday. The Steel Corporation officials admit that the matter has been under consideration, but that nothing will be made public until Mr. Gary's return.

**Making Steel Sash.**—Operations were commenced last week by Steel Sash, Ltd., London, makers of window sashes. This organization secured the Canadian patent rights from the American firm operating at Paterson, N.J. It is stated that total business in Canada for these products amounts to $2,000,000 annually, and the London plant expects to have a turnover of $200,000 in its first year. Three other plants make a similar line of products in Canada.

**New Power Plant.**—Parmenter and Bulloch, Ltd., Gananoque, Ont., are building a new power plant at a cost of $40,000. They have installed a Wickes boiler, 200 horse-power, also a Skinner engine, 150 horse-power (Unaflow type); Weber stack of reinforced concrete by the Weber Chimney Co., Chicago; Smith gas producer, 150 horse-power, by the Smith Engineering Co. This plant was designed and constructed under the supervision of W. Rees, M.E., who is also mechanical superintendent of Parmenter and Bulloch. J. S. McIntyre, who has been with Parmenter and Bulloch for the past fourteen years, is the operating engineer.

**New Windsor Plant.**—The new plant of the Toledo Scale Company at Windsor was opened recently, and the Canadian sales force is holding its convention coincident with the opening of the factory. The new building is of modern construction, with about 40,000 square feet of manufacturing space. The company proposes to do export business to other parts of the British Empire from its Canadian plant. An application has been made for a Dominion charter, and the name of the organization will be Canada Toledo Scale Company, Limited.

**Want Tenders**—The Canadian National Railways, eastern lines, are calling for tenders for the construction of eight concrete structures. W. A. Kingsland, C. N. R., Montreal, is receiving tenders and particulars can be had from the office of the engineer maintenance of way.

**Conditions Better.**—The Ontario Steel Products Co., of Gananoque, find that business has improved very appreciably during the past month. David Bain, who is general manager, when speaking to Canadian Machinery, stated that he is very optimistic about the business outlook as a whole, and looks for a general improvement in the very near future.

## SCOTIA STEEL HAVE ANNUAL MEETING

**Feeling Seems To Be That Worst Has Passed, and Future Is Faced Confidently**

New Glasgow.—The annual general meeting of the shareholders of the Nova Scotia Steel & Coal Company was held at the offices of the company in New Glasgow on March 30, at which the annual report of the company for the year 1920 was read and unanimously adopted. The president and management were congratulated by a number of the shareholders present on the excellent showing made during the past year, in the face of the none too promising prospects at the time of the previous meeting of the shareholders held in March, 1920, and all of those who spoke expressed the hope that although there was at present a world-wide trade depression, the worst had passed, and that the future might be looked forward to with confidence.

## PRICES BEING CUT IN CHICAGO

**Warehouses Are Out in an Effort to Get the Buyers to Come in and Take Hold**

Price reductions are announced by leading steel warehouse interests in Chicago on practically all grades of stock. Union Station Co. has placed the order for 7,000 tons of structural steel for the new railway mail postoffice with the McClintic-Marshall Co., of Pittsburgh. Price is understood to be slightly under $74 a ton comparing with $95 to $105, the prevailing level six months ago, and the pre-war range of $50 to $55.

The cut was made in the first place because auto interests and others were showing no tendency to come into the market.

About $15,000 damage was done to the New Toronto Leather Works in the recent fire. The loss is practically covered by insurance.

## RAILWAY SHOPS LET WORK SLIDE

**Claim Costs Are Too Great Too Keep The Rolling Stock In Proper Repair**

CHICAGO. — With their revenues so diminished that they are unable to earn operating expenses, the railroads have undertaken drastic measures of retrenchment. Blocked in their efforts to reduce wages and to change working conditions, the carriers have had but one course left to them, namely, the curtailment of their working forces. Wherever an employee can be dispensed with without actually interfering with the operation of trains, he is being laid off.

Railroad shops are fast being closed. Within the past few days the Delaware & Hudson has discontinued operations in its Colonies shops near Albany, N.Y., and this action will soon be followed by the closing of the Green Island, N.Y., and Oneonta shops of the same road.

The New York Central shops at West Albany have been shut down. These instances are typical of what is happening all over the country. As a result, necessary maintenance and repair work is being postponed indefinitely. It is estimated on good authority that ten per cent. of the entire freight equipment of American railroads is now in bad order, and this proportion is steadily being increased. When a car gets in bad repair, the railroad switches it on a siding, where it will remain until reduction in labor costs justifies its renovation.

### ALLOWANCES FOR RUNNING AND FORCE FITS

| RUNNING FITS | | FORCE FITS | |
|---|---|---|---|
| Diam. of Bearing | Diam. of Shaft | Diam of Hole | Diam. of Shaft |
| 1 | .999 | 1 | 1.001 |
| 2 | 1.998 | 2 | 2.003 |
| 3 | 2.997 | 3 | 3.005 |

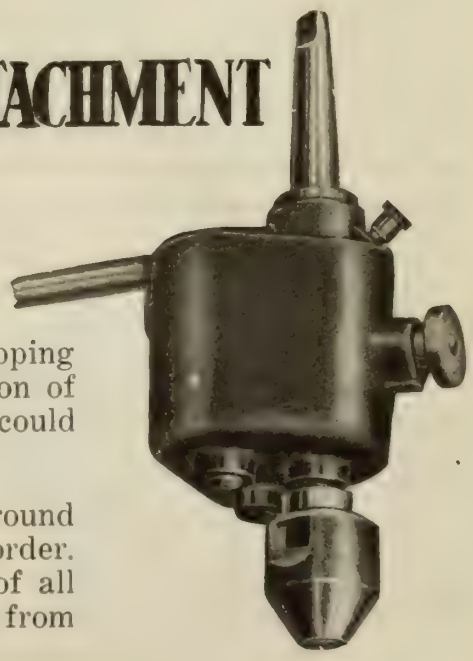
Allowances for Drive Fits are one-half that of Force Fits.

# Aikenhead's Canada's Leading Tool Supply House

We are at all times able to fill your orders promptly—be they large or small. Our large stocks enable us to supply "Everything in Tools." When you require tools—think of Aikenhead's.

# Johansson



*The World's Standard of Accurate Gauging*

Introduce the "Limit System" into your shop with a set of Johansson Gauges. They assure equal results on all work, even in the hands of unskilled operators. They cut the time required for gauging in half—no inconsiderable item in these days of high production costs.

The Johansson book tells all about Johansson Gauges. If you haven't a copy, write to Aikenhead's for one to-day.

# Wahlstrom's Tapping Attachment

## *Ten Times as Fast*

Why stick to the old slow and expensive practice of hand tapping when you can do the same work in one-tenth the time with a Wahlstrom Automatic Tapping Attachment? It imitates the simple to-and-fro motion of hand tapping and will tap holes as squarely as they could be drilled.

The Wahlstrom is constructed of hardened and ground parts and has nothing whatever that can get out of order. It is manufactured in two sizes. No. 1 takes taps of all sizes from 5-40 to ½-inch standard. No. 2 takes taps from ¼ to ¾ inch.

## Aikenhead Hardware, Limited

# Have You Tried This Contest Yet? If not--- Do so Now

Below will be found twelve references to advertisements in this number. To the sender of the first correct set of answers to these we will forward one of these scales.
To win one is not difficult, and at the same time you will add to your store of knowledge. Read the details given below.

The scale is 6 in. long and is made from finest quality steel. One side is marked in 32nds, the other side in 64ths. A table of decimal equivalents is also stamped on one side, and a table of tap drill sizes on the reverse side. This scale is well worth securing.

## What You Have to Do

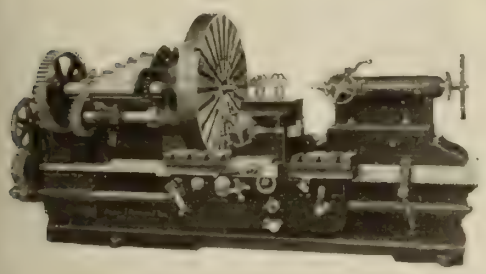
We publish every week a number of interesting facts or statements selected from the advertising pages for that week. The selections for this issue are given below. Read these through, then turn to the advertising section and see if you can pick out the advertisements to which they refer. The work is interesting, it will train your powers of perception and of memory, it costs you nothing, it will make you better acquainted with the various lines of machinery and tools in the market, and with perseverance you are bound to win one of these useful scales as a prize.

Eleven contestants sent in correct lists to the March 17th contest. We had again to resort to the elimination process, and Macklin Cunningham, Litchfield Conn., U.S.A., was the lucky one. This method of picking the winner is fair to everyone, for it does away with the distance problem. No matter how far away a subscriber lives, he has three weeks from the date of issue to send in his copy. On another page will be found the names of the other ten readers who forwarded correct lists.

**CONTEST FOR APRIL 7 ISSUE**

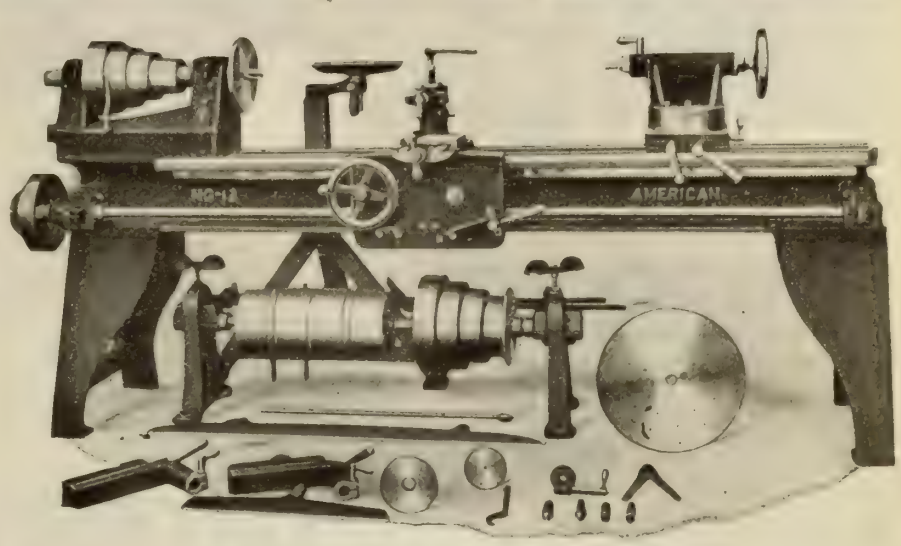
**Contestants are required to write us, stating to which advertisements we refer in this number.**

1 A case where brute strength pays.
2 How to get away from paying exchange.
3 A case where back draft is impossible.
4 How to protect your staff against disorganization.
5 How to ensure speed and easy manipulation.
6 A case where steers are very useful.
7 How to reap dividends quickly.
8 Something that contains no holes at the top or sides.
9 A product said to take the place of reamers.
10 Something that is always at your service.
11 A job that's done in less than a minute.
12 Something that is fully guaranteed.



**These are Correct Answers for List from March 17th Issue:**

1—Roelofson Machine Tool Co. Ltd.
2—Kearney and Trecker Co.
3—Northern Electric Co. Ltd.
4—Ford-Smith Machine Co. Ltd.
5—C. E. Johansson, Inc.
6—The Toledo Machine & Tool Co.
7—The Holden Co. Ltd.
8—J. H. Williams & Co., Ltd.
9—E. C. Atkins & Co.
10—W. S. Rockwell Co.
11—J. Ackworthie, Ltd.
12—Independent Pneumatic Tool Co.



## Closing Date for This Contest is April 28th.

# GARLOCK-WALKER MACHINERY CO. LIMITED

# MONTREAL NOTES

The Oliver Engineering Co. are removing their Montreal offices and show rooms from 296 St. James Street to 307 St. James Street. This firm has recently installed some large hand operated cranes in the new power plant of the Montreal Harbor Commissioners and also in the plant of the Anglo-Canadian Wire Rope Co.

A large portion of the plant of the Record Foundry and Machine Co., at Moncton, N.B., was destroyed by fire last week; the damaged section is that of the warehouse and machine shop. Considerable stock was carried in the warehouse at the time of the fire. The loss was fully covered by insurance. Reconstruction work will be commenced immediately.

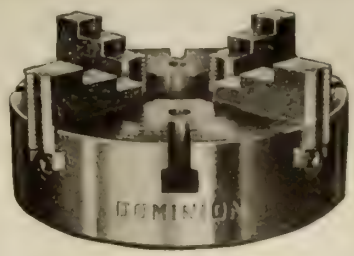
A. J. Hopkins, of 392 St. James Street, Montreal, has secured the Canadian agency for the Red Devil dolly jacks, and arrangements have been made for the manufacture of this line in Canada. Mr. Hopkins has likewise obtained the agency for the Billmont tools manufactured by the Edgar C. Guthard Co., of Chicago. This is a line of interchangeable sockets and wrenches.

The Corundo Steel Co., Ltd., have acquired the old Record Foundry and Machine plant at 17 Mill Street, Montreal. The purpose of the company is to establish a factory for manufacturing cutting and percussion tools from low-grade steel and by a special chemical heat treating process convert it into a product equal in quality to high-grade tempered steel, suitable for a variety of conditions. Oscar Schenk is managing director.

W. J. O'Leary, electrical engineer, of Montreal, has developed a new type of electrical motor, based on the utilization of harmonic vibrations for the source of power. The weight of the rotor is about one-sixth that in an ordinary motor of the same horsepower, and it is stated that a saving of from 20 to 50 per cent. is effected in current used. The invention has been patented in twenty-six different countries, and it is claimed that it can be applied to any machine requiring power for its operation.

An incorporated company to be known as the Prince Edward Island Light, Heat and Power Co. has recently been formed to supply light, heat and power by the use of electricity to all parts of Prince Edward Island, from one large central power station, using coal for generating purposes. It is expected that permanent employment will be provided for about 200 men. Noah A. Timmins, multi-millionaire, and W. J. O'Leary, electrical engineer, both of Montreal, are interested in the company.

The Black and Decker Manufacturing Co., of Baltimore, Md., are opening a new Canadian plant and sales office in Montreal. A. J. Hopkins, who for some



me. past has been connected with this rm, will assume the management of the anadian business. Mr. Hopkins has een associated with the machine tool rade for a number of years. The Mont-eal offices will be located at 392 St. ames Street.

E. McG. Quirk, of the Federal Labor epartment, is now in Cape Breton dis-rict on behalf of the Dominion Govern-ent for the purpose of investigating onditions relating to the steel industry. he primary reason for this move is the equest of the steel workers for a fed-ral inquiry into the situation existing n that section, particularly in connec-ion with the recent wage reductions ade by the steel companies.

The Department of Marine and Fish-ries announce that the laying of the 00 buoys in the St. Lawrence, between ontreal and Quebec, will be commenced his week; the completion of this work arks the official opening of the river or ocean vessels. While it is expected hat cargo vessels now in route may be iverted from their usual winter destina-ion, owing to the earlier opening of nland navigation, it is not anticipated hat any great change wll be effected in assenger traffic, as it would be inadvis-ble to interfere with the prepared chedule.

Canadian Vickers, Ltd., have an-ounced that the first launching of the eason will take place on Saturday of this week, when the Norwegian cargo teamer "Idefjord," constructed for the hipping firm of Den Norske Amerika-linje, of Christiania, Norway. Another essel for Norwegian register will be launched from this yard in the course of the next few weeks. Two Canadian Merchant Marine freighters, launched last fall, will shortly be turned over to the owners. The outlook for future building at this yard has been clouded by the prevailing high costs of con-struction work and the keen competition from yards in other countries.

With the passing of winter construc-tion work has again started on the large old storage plant being erected at the port of Montreal by the Harbor Com-missioners. It is expected that the structure will be sufficiently advanced this summer to enable the lower floor and basement to be used for the handling of perishable goods before the closing of the 1921 season. Work on the power house for operating the refrigerating equipment, and the transforming of power for use on the electrified rail-roads of the port, has proceeded through-out the winter, and this will be ready for operation in a very short time. An im-mediate start is to be made on continu-ing the work of electrifying the re-mainder of the harbor service, and it is hoped that this will be finished by fall.

DOMINION CHUCKS

STEEL OR CAST-IRON BODY
BUILT FOR HEAVY DUTY

All Screws Are Reversible

SCREWS are made of the best grade steel. Both ends are broached and are heat treated after machining. They are reversible, so that either end may be used, are large enough in diameter to stand the torsional strains applied by operator when setting up his work. They are made to give the best service—and may be depended upon to stand up under the hardest usage.

2 H.R.T. BOILERS, 60 IN. X 14 FT., 120 LBS. working pressure.
1 H.R.T. BOILER, 42 IN. X 14 FT., 130 LBS. working pressure; rear suspended.
Box 766F, Canadian Machinery.

### REGO WELDING *and* CUTTING APPARATUS

Oxygen, Acetylene, and a complete line of Welding and Cutting Supplies.

**Carter Welding Co.**
**of Toronto, Limited**
**7-11 Sheppard St., Toronto, Ont.**
Phones: Adelaide 2841 and 1524 (TF)

### CLOSING TIME

Advertisements for this section must be in our composing room Tuesday morning prior to day of issue.

In order that the announcements of your wants, machinery for sale, etc., etc., shall not be delayed, please try to have them in our office with the Tuesday morning mail.

**Canadian Machinery**

### General Machine Pattern and Sheet Metal Work

If production is required

**Let our Battery of Bullards do it**

Large and small machine work our specialty. Our facilities assure first-class production with maximum efficiency. Before ordering get our estimates by mailing us your blue prints, or have our representatives call on you.

**Rubber Machinery Shops**
**Canadian Consolidated Rubber Co. Limited**
**Kitchener, Ont.**

## AGENTS WANTED

AMERICAN FIRM, SPECIALIZING IN OXY-acetylene welding and cutting equipment, is desirous of securing representatives and agents in Canada. Apply Box 763F, Canadian Machinery.

## POSITIONS WANTED

POSITION WANTED—MACHINE SHOP SUperintendent or general foreman. Acquainted with modern machine shop practice and heat-treatment of steel. Thirty years' experience. Production or contract work. Box 757, Canadian Machinery.

## MACHINE WORK WANTED

MACHINE WORK WANTED FOR LATHES, shapers, milling machine and planer, etc. Hourly or contract basis. Prompt delivery. W. H. Sumbling Machinery Co., Toronto. (ctfm)

### MACHINE WORK WANTED

We are equipped to handle all kinds of general or special machine work. All operations in our plant are done under the most careful supervision and we can satisfy you as to price. Always available for consultation.

**PERFECT MACHINE COMPANY, GALT**
Builders of Reliable Machinery.

Phone Park. 3550 House: Coll. 9660W

### Re-Built Machinery For Sale

1—24" x 12' Canada Machinery Lathe.
2—22" x 10' Davis Lathes.
1—21" x 10' London Lathe.
6—20" x 8' C.M.C. Lathes.
1—18" x 8' Mueller Lathe.
1—18" x 8' London Lathe.
3—18" x 8' C.M.C. Lathes.
1—16" x 6' McDougall Lathe.
1—14" x 8' London Lathe.
1—14" x 6' Flather Lathe.
2—No. 1 Racine Hack Saws.
4—20" McDougall Drills.
1—22" Barnes Drill.
1—28" Barnes Drill.
1—D-1 H.D. Colburn Drill.
2—No. 24 H.D. Foote-Burt Drills.
1—16" C.M.C. Shaper.
1—24" Rockford Shaper.
2—2" x 26" Pratt & Whitney Turrets.
1—10" x 52" Plain Landis Grinder.

Specifications and prices sent upon request.

## Steel Plant Equipment

6—Herault Electric Furnaces, 6 ton, tilting type, complete with transformers and auto regulators.

18—Williams Cut Off Machines, hollow spindle, taking up to 9½" bar stock.

1—Ajax Bulldozer, No. 12, jaw opening, 54" x 72" deep, approximately 12" stroke, sliding head.

6—Deane Horizontal, double plunger Pumps, 4⅛" x 18", capacity 200 gallons at 1,500 lbs. working pressure, being motor driven and complete with motors.

4—Kennedy Billet Shears, double head, 14" capacity.

1—Combined Punch and Shear, 10" throat.

8—New, Pittsburgh Ladles, cast steel, bottom discharge, 15 ton.

4—Used, Pittsburgh Ladles, cast steel, bottom discharge, 12 ton.

5—Used, Steel Plate Ladles, bottom discharge, 9 ton.

1—Used, Tilting Type, Ladle, capacity 6 ton.

**APRIL OFFERINGS AT SPECIAL PRICES**

1 26" x 10' C.M.C. Engine Lathe, 3 step cone, D.B.G., Q.C.G., complete.
1 22" x 10' Devenport, 3 step cone, D.B.G., Q.C.G.
1 21" x 10' Sidney, 3 step cone, D.B.G., Q.C.G.
1 20" x 10' C.M.C., 3 step cone, D.B.G., Q.C.G.
1 18" x 8' Greaves Klausman, 3 step cone, D.B.G., Q.C.G.
1 17" x 8' Sidney, 3 step cone, D.B.G., Q.C.G.
1—16" x 6' Rahn Larmon, 3 step cone, S.B.G., Q.C.G.
1 14" x 6' Screw Cutting Engine Lathe, 3 step cone, S.B.G., compound rest complete with chuck.
2½ x 24 Jones & Lamson, complete with collets and regular equipment.
3 x 26 Jones & Lamson, complete with collets and regular equipment.

**MISCELLANEOUS**

1—No. 9B Hendey Whitmore, Double End Punch and Shear, ⅝ in ⅜.
1 No. 4 Greenard Arbor Press, complete.
1 24" McGregor Gourley Shaper, B.G., power traverse.
1 No. 3 Ballantyne Self-feed Saw Table, 12" saw.
1—No. 1 Ballantyne Pedestal Shaper, 22" between spindles, complete.
1 16" Harper Jointer, square cylinder gauges, complete.
1 26" Harper Planer, complete with counter shaft.
1—8" Four-sided Cowan Moulder.
1 Cowan Horizontal Shaper.
2 Cowan Boring Machines, upright, foot treadle.
1 Cowan Disc Sander, wooden frame.
1—No. 2 Sutton Double End Punch and Shear, S.G., 8" throat, 4½" shear blade with 8" throat and ½" punch.
1—20" Barnes Drill, plain, wheel and lever feed, round table and base.
1 Ball Bearing Emery Wheel, pedestal type, 36" spindle, complete.
1—Perrin Hydraulic Press, ram 8" diameter, tight and loose pulley.
1—Air Compressor with two tanks.
1—66" x 14' boiler, complete with fire front grate and fittings.
1—New London Concrete Mixer, mounted on truck with engine and boiler.
1 10 x 24 Landis Grinder, complete with standard equipment.

The above is only a partial list of machines available and offered at prices that will convince the prospective buyer that they are saving money.

Send us a list of your requirements.

## SMALL LIST OF SPECIAL MACHINES FOR QUICK SALE

10′ to 16′ **Bertram** Vertical Extension Type Boring Mill, swings 11′ when closed, 20′ when extended, takes 7′ 6″ under tools; two heads on rail and auxiliary boring head.

8′ Universal Radial Drill, spindle 4″ dia. with plain box table; base of T pattern 12′ x 4′ 3″; belt drive.

Two 12′ Wall Radial Drills (countersinking drills).

**Bertram** 6-Spindle Independent Feed Drill, spindles 2¼″ dia., feed 13″, table 12′ 3″ x 24″.

1,500-lb. **Bement** Double Frame Steam Hammer, complete with operating valve, anvil, etc.

30′ x 12′ x 8½′ **Smith, Beacock & Tannett** Planer, two heads on rail, table 29′ between pockets x 8′ wide, heavy cored section housings.

36′ x 36′ x 12′ **Belmer-Eames Planer,** two heads on rail, two side heads.

**Bertram** Double-end Punch and Shear, 42″ throat; will punch 1½″ in 1⅛″ plate, and shear 8″ x 1″ flat.

**Edwards** Double-end Punch and Shear; punch 38″ throat, capacity 2″ in 1″ plate, shear 30″ throat, with splitting blades 18″ long; angle shear in centre of frame for 6″ x 6″ angles.

**Cleveland** Style "C" Single-end Punch, 24″ throat; will punch 1″ in ½″ plate; architectural jaw.

**Bertram** Double-angle Shear, will cut 6″ x 6″ angles.

**Bertram** Horizontal Punch, capacity 1″ in 1″ plate, 16½″ gap.

**Lennox** Rotary Plate Bevelling Shear, capacity ¾″ plate.

**Beatty** Self-propelling Derrick Car, 30′ boom, derrick is "A" frame type, hoist 7″ x 12″ double cylinder, double drum, with link reverse; all mounted on 34″ x 10″ standard flat car.

Five-ton **Wilson** Revolving Locomotive Crane, standard gauge, 25-ft. boom, engine 7″ x 10″ double cylinder, truck frame 9′ 6″ x 6′ 6″ on four wheels.

42″ Style "A" **West Side** Power Feed Band Rip Saw; table 52″ x 42″.

54″ **McDonough** Horizontal Band Re-saw with bevel sliding attachment; has power feed and will take stock up to 30½″ wide x 12″ thick; takes 7″ saw.

No. 640 **American** Eight-roll **"Boss" Timber** Sizer; will surface all four sides on timber up to 30″ x 20″; has six rates of feed and is furnished with forged steel cylinders, chip-breaker, etc.; belt-drive.

***In our warerooms we have a large stock of new and used machinery of various sizes and makes.***

# You knew this Kid

You used to play with Jimmy on the sand lots—he was a speedy youngster, pitched an elegant game, but when it came to a really tough, hard-fought scrap he didn't have the strength—the bull dog *sticktoitiveness* to lick.

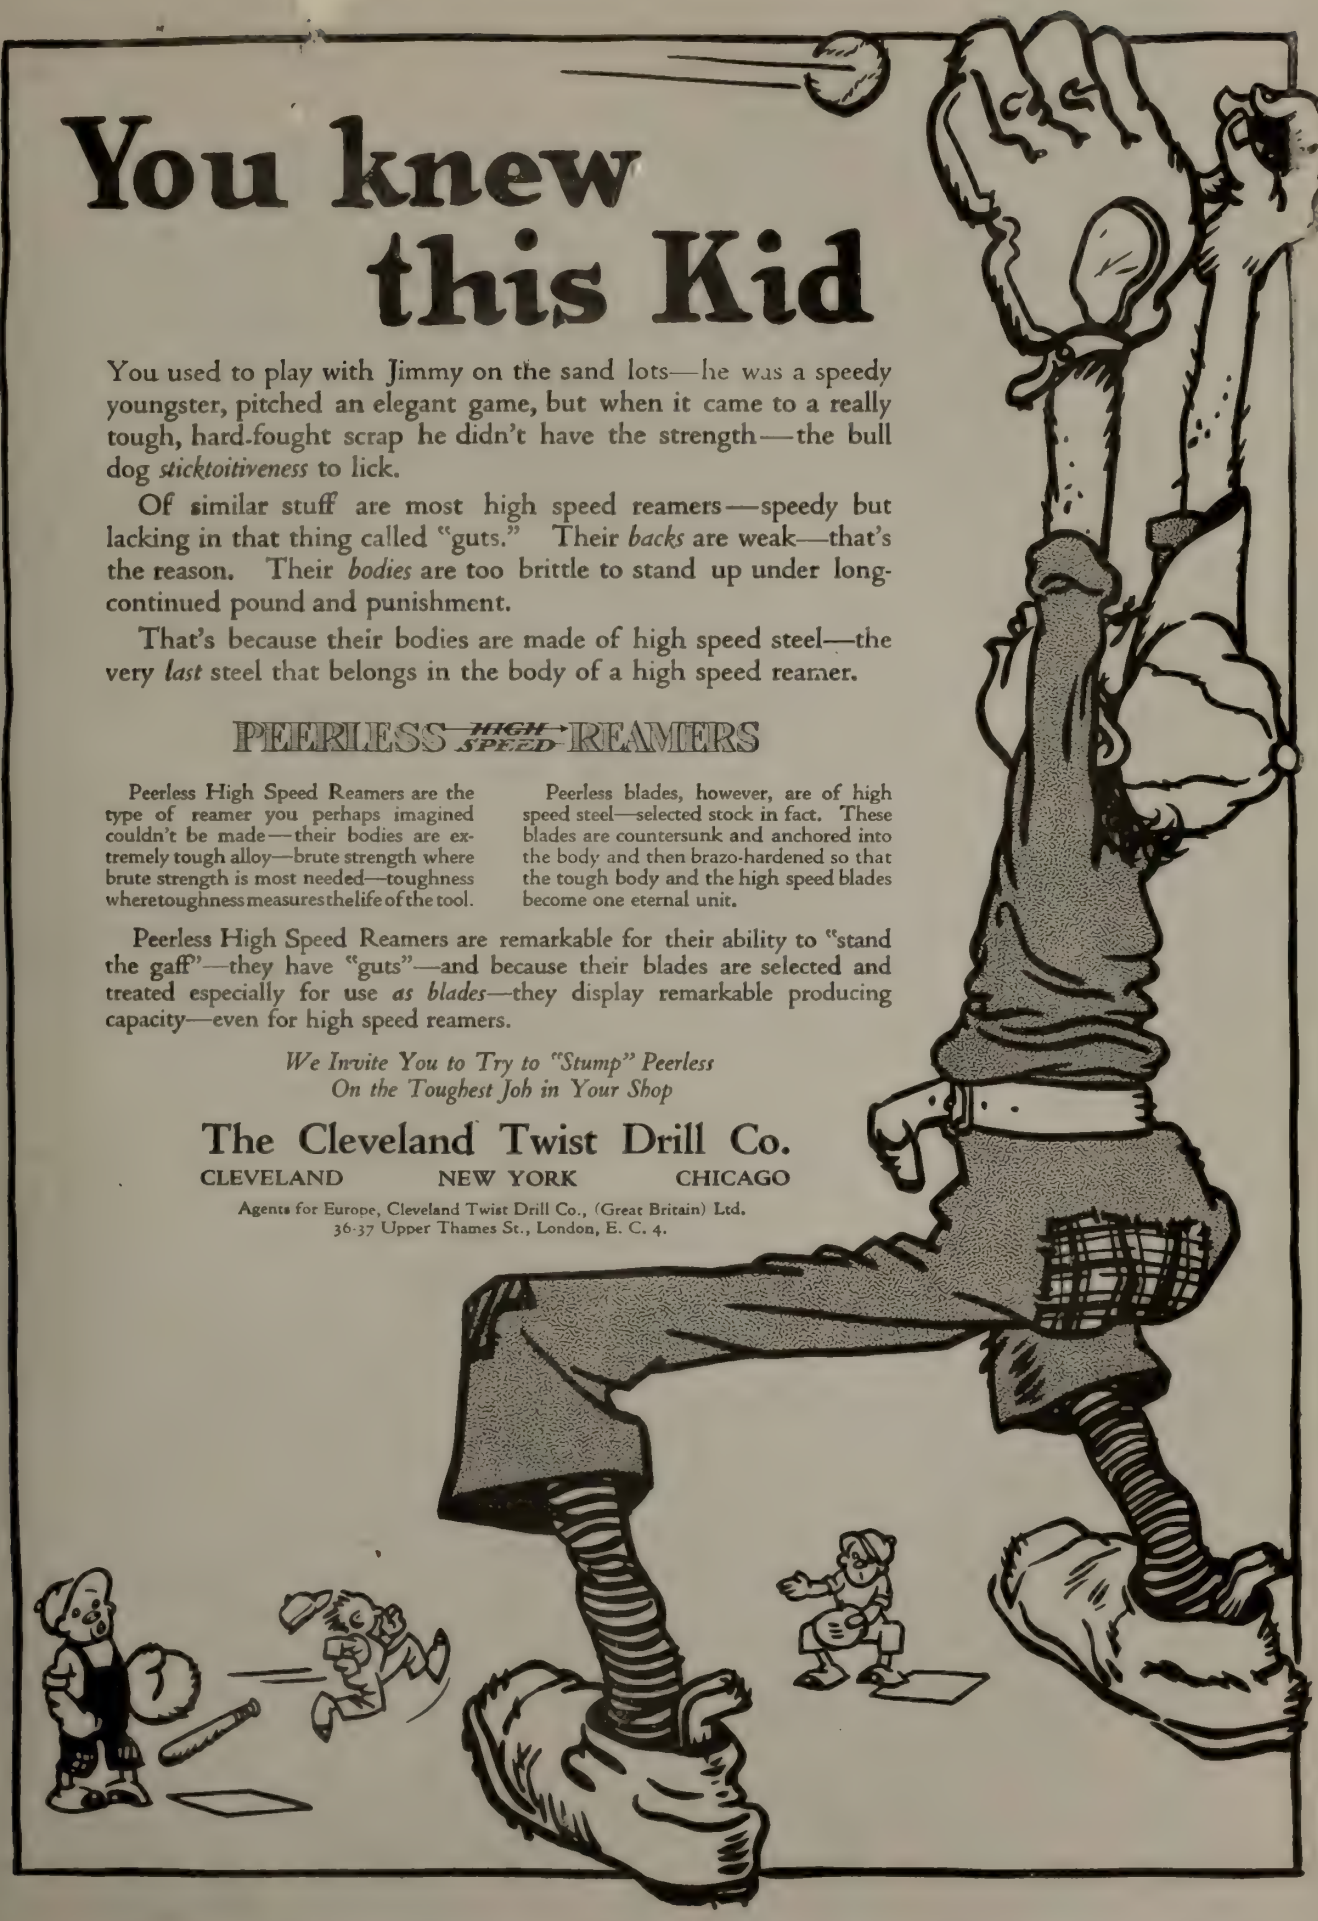
Of similar stuff are most high speed reamers—speedy but lacking in that thing called "guts." Their *backs* are weak—that's the reason. Their *bodies* are too brittle to stand up under long-continued pound and punishment.

That's because their bodies are made of high speed steel—the very *last* steel that belongs in the body of a high speed reamer.

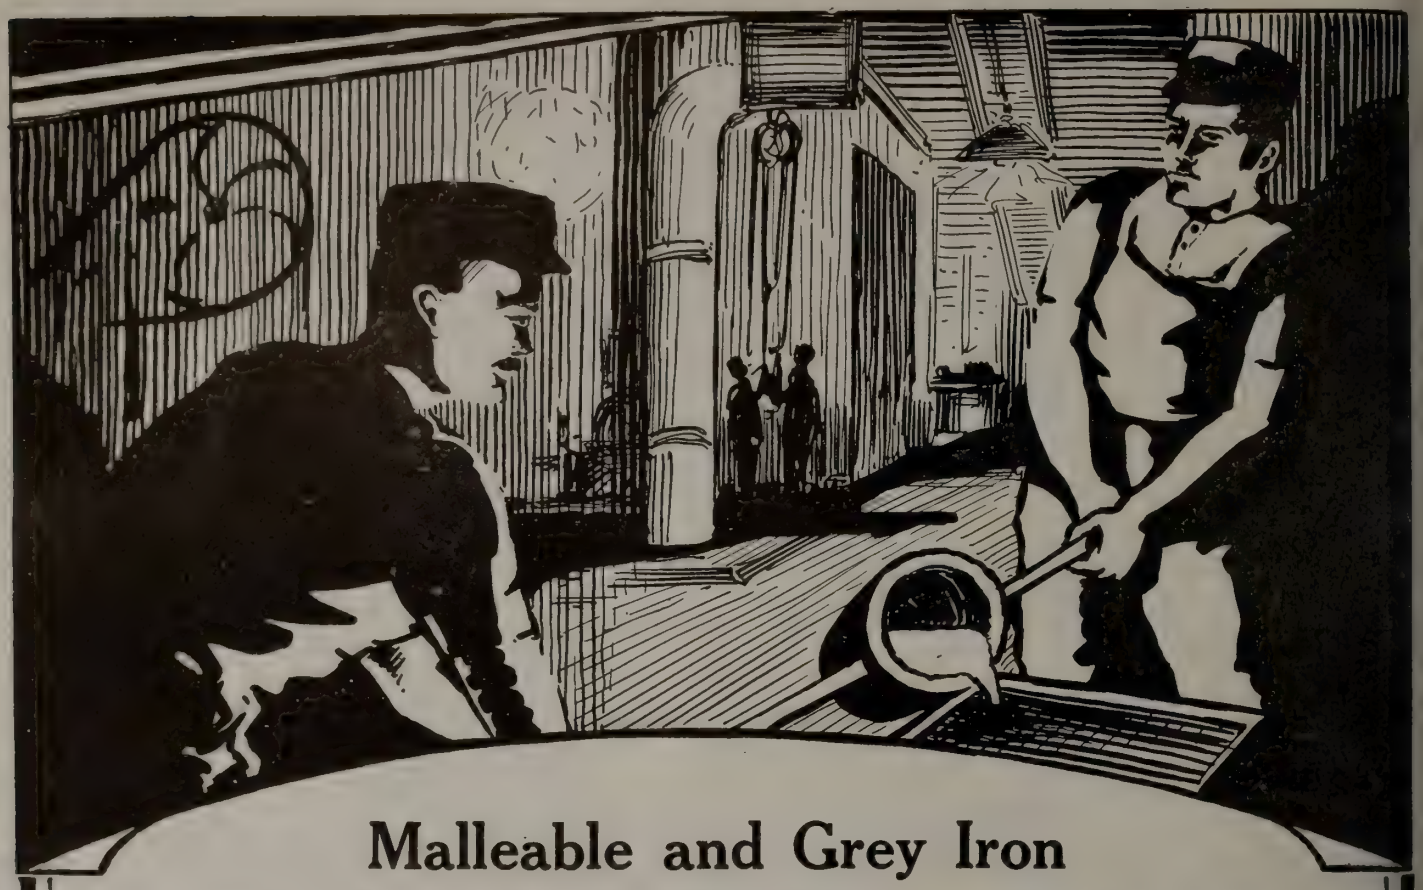
## PEERLESS HIGH SPEED REAMERS

Peerless High Speed Reamers are the type of reamer you perhaps imagined couldn't be made—their bodies are extremely tough alloy—brute strength where brute strength is most needed—toughness where toughness measures the life of the tool.

Peerless blades, however, are of high speed steel—selected stock in fact. These blades are countersunk and anchored into the body and then brazo-hardened so that the tough body and the high speed blades become one eternal unit.



Peerless High Speed Reamers are remarkable for their ability to "stand the gaff"—they have "guts"—and because their blades are selected and treated especially for use *as blades*—they display remarkable producing capacity—even for high speed reamers.



*We Invite You to Try to "Stump" Peerless*
*On the Toughest Job in Your Shop*

## *Large Capacity--Quick Service*

The Machinery Manufacturer, the Agricultural Implement Maker, the Automobile Builder, and Specialty Manufacturer—can secure his Malleable and Grey Iron Castings quickly when he orders International Malleable Products. We have the facilities for making exceptionally good deliveries on the largest of orders.

Specify "International Malleable" on your next order for Malleable and Grey Iron Castings, and Malleable and Grey Iron Pipe Fittings.

In addition to quick service you secure reasonable price and quality products.

# "ECONOMY"
## Parallel Ruler Attachment

A simple arrangement which does not interfere with work on the drafting board in any way. It does away entirely with the clumsy "T" square and the necessity of watching to see that it is always against the edge of the board.
Invaluable to draftsmen, absolutely accurate, quickly lifted clear of board for changing drawings.

# Jones Is a Punctual Worker *but*— Is Jones a Productive Worker?

**The Factory Manager who is up-to-date will tell you at a glance. He uses Job Time Clock Records.**

International Job Time Recorders offer the most accurate means of accounting for every employee's time, and of showing to what job it is charged.

They show the starting time of each job. They show the stopping time of each job. They tell whose time and how much time has been put into a specific job.

The record is printed, legible, accurate—there is no research; there are no questions and no disputes.

**Oldest and Only Made in Canada**

As pioneers in the Time Recording Industry we have advanced from a very simple beginning. To-day we are the largest manufacturers in the world of payroll and job time recording equipment. Our products are everywhere accepted as the best word in time recording equipment. They are made in Canada.

## International Time Recorders

**Account For and Protect, Minute For Minute, Your Time Investment**

The illustration above shows how the modern, efficient factory manager is enabled to check his "Job" time with his "In and Out" time. The International Time Recorder records show in an instant the total of non-productive time in any department in any week or month. Non-productive Time means a Payroll leak—Stop it!

# "Oliver" Band Saws

Age is a relentless sifter of equipment. Only the best survives. An "Oliver" five-year-old is in its youth; an "Oliver" ten-year-old is in its prime with earning power unimpaired.

Here is an "Oliver" Band Saw surviving inferior equipment in the up-to-date pattern shop of the Chase Metal Works at Waterbury, Conn., a shop where they spare no pains to make every operation as efficient as possible.

This Band Saw is guarded in accordance with the very best practice. The bearings are large and frictionless and with the iron wheels milled even on the inside and perfectly balanced, steady operation and uniform sawing results.

Adapted to a wide variety of work the "Oliver" Band Saws have met with the approval of a great number of the largest woodworking concerns throughout the world. Let them demonstrate their working qualities in your plant.

SKINNER CHUCKS

T-M.

# For Better Chuck Service

We have manufactured chucks for thirty odd years, and during this time have naturally acquired much data and information not in the possession of chuck users generally. We felt that this information, placed for ready reference in the hands of those interested in chucks, would help them to secure the fullest measure of service from their chucks. Therefore, we have just published a conveniently sized hand-book entitled

# "CHUCKS AND THEIR USES"

Those interested will receive a copy of this book without charge. It includes:

- A history of chucks, and their development;
- A full description in every-day language of the different types of standard chucks;
- Suggestions for the proper care of chucks;
- Best methods of fitting chucks to lathes;
- Suggestions for general shop practice.

A number of these books, distributed among the mechanics in shops, should prove of value. A copy will be sent free upon request to anyone giving personal name and occupation.

***Write for your copies now. No charge***

# Robertson Process Ventilators

## *Made of Robertson Process Metal*

The air is drawn out of the building—Automatically! A partial vacuum is created. Back draft is impossible. Maximum ventilation is the result.

These are some of the advantages you will find in Robertson Process Ventilators. And these advantages are insured, for this Robertson Product is made entirely of Robertson Process Metal—a building material that cannot rust or corrode—a protected metal in which the specially annealed steel core is completely encased (both surfaces and edges) and hermetically sealed. Rust and corrosion are avoided. All elements of deterioration, whether caused by weather conditions or manufacturing processes, are successfully overcome by Robertson Process Metal. Painting is made unnecessary. Upkeep costs are reduced to a minimum.

Further advantages of Robertson Process Ventilators are explained in an illustrated bulletin which will be gladly sent upon request, together with an actual sample of Robertson Process Metal.

## METAL FOR ROOFING AND SIDING

*Name of Hardware Merchant and further details, supplied upon request*

# The Answer is—He Didn't!

THE crowd was drawn by a hardware firm in an Ontario town of 700 population. This crowd of over 1,000 people represents customers of the store, drawn from miles around, to attend the picnic given by this firm to its customers. Surely this is evidence of the close relationship between this hardware firm and its customers.

The close relationship between retailer and customer in this instance is typical of conditions existing in hundreds of Canadian towns, villages and cities.

The average hardware merchant (particularly in the smaller cities and towns) has been established for many years. He has a big business connection built up through years of efficient service to his customers. He is well rated, and a desirable man with whom to do business. He influences the buying habits of the people in his community, and in over 90% of the sales made, he is the deciding factor.

*"Which one do you recommend?"* is a question asked thousands of times each day in the hardware stores of Canada.

If you can get the effort and enthusiasm of the retail hardware merchants and their clerks, plus their window and interior displays and local advertising behind your goods, you will have secured the co-operation of one of the greatest available selling forces.

HARDWARE AND METAL is paid for, and read, by all the wholesale hardware buyers of Canada, and over 90% of the retailers from coast to coast. They are the men who control the sale of your products to the hardware consumers. HARDWARE AND METAL can put your story before, practically, the entire Canadian hardware trade. One of our representatives would be glad to give further details.

(Only hardware paper in Canada with membership in the Audit Bureau of Circulations).

## HARDWARE & METAL

*Canada's National Hardware Weekly since 1888*

**143-153 University Avenue - - Toronto, Canada**

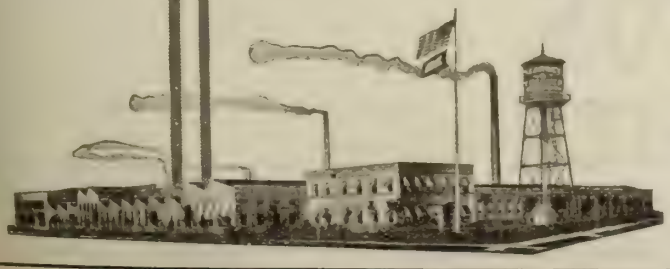
# MILWAUKEE MILLING MACHINES



Continuous milling of 10-inch adjustable wrenches on a Milwaukee Vertical Milling Machine. These parts are turned out at the rate of 3,000 a day and the finished surface bears a constant and accurate relation to other selected points on the part.

## *Rapid, Economical Milling*

Manufacturing milling by the continuous process is an advanced step in milling machine practice that is worthy of the serious consideration of the management of any plant. The motion in this milling process is continuous. It is reasonable, therefore, that in this way maximum production is secured. This sort of milling is most desirable in the machining of parts in large quantities. The rotary table with chucking fixture holding the work revolves, and the cutter is in operation and in the work at all times. The operator removes the finished piece and puts another unmilled one in its place.

Milwaukee Vertical Milling Machines are particularly well adapted to continuous milling. The spindle is adjustable for wear only as sufficient adjustment can be obtained by the adjustment of the knee alone, the same as it is in the horizontal type milling machines.

Have you any milling that would be well adapted to continuous milling? Let us help you.

Showing installation of Skinner Bros. (Baetz Patent) Heaters in foundry of Best Foundry Co., Bedford, Ohio. Note extensive area served.

# Heat Your Plant the Logical Way

Install the Skinner Bros. (Baetz Patent) Heating System and every corner of your plant will be kept at the same uniform, comfortable temperature, regardless of weather conditions. This is the logical method of heating — there are no places always too warm while others are too cold — no long, cumbersome pipe lines or air ducts.

The Skinner Bros. (Baetz Patent) Heater applies only natural laws and is simple and positive in action. It is portable; requires no special foundations; installation cost is 15% to 50% less than any other system, with equally low operating costs. Creates no drafts or air blasts, does not disturb floor dust and maintains comfortable, healthful working conditions always.

Performance guaranteed — if a Skinner Heater should ever fail, it would become immediately returnable to the factory and every cent of your money refunded.

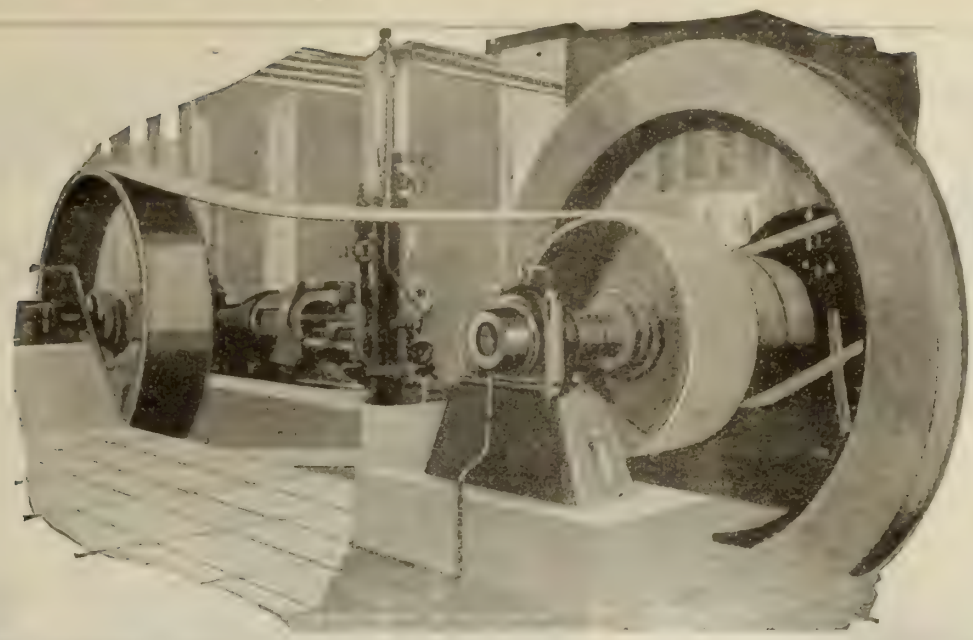
### Mechanical Details

Built as an individual enclosed unit with a series of pipe coils compactly mounted above a powerful fan-wheel. Coils are heated by exhaust or live steam. Cold air is drawn into the heater by the fan, impelled upward and around the coils, and, after being heated, is diffused through outlet hoods to every part of the open area. No pipes or ducts used. The fan is operated by any power available.

### Direct-Fired Type

Where steam is not available, we supply our direct-fired type DF, which burns coal, coke or wood. Built on the same scientific principle as type SC. The fan is operated by any power available.

### Send for Full Particulars



Find out more about this wonderful heating system—we will send complete details and list of users on request.

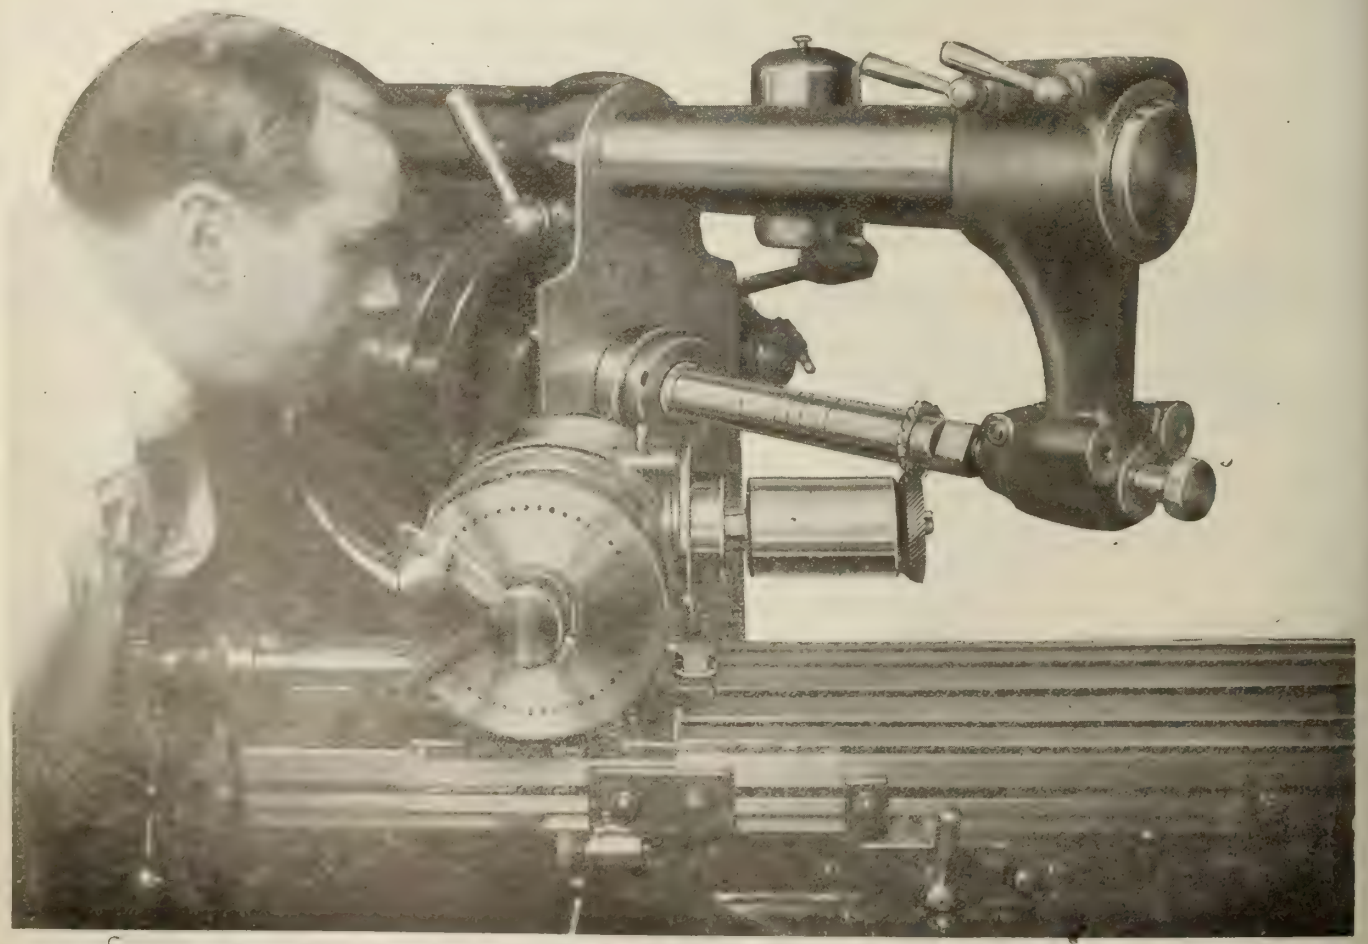
# HENDEY

# *Milling Insurance*

When you take out an accident insurance policy you feel that it is well worth the money you pay in premiums—"just in case." The only trouble is you have to get hurt to secure any money from your investment.

When you purchase a Hendey Miller you reap dividends from the moment you put it in use—and its initial cost is the only premium you pay!



The use of Hendey Millers guarantees the speed and precision with which your milling can be accomplished. The unfailing satisfaction which each machine renders its user is the reason why "the purchase of one Hendey means the purchase of more."

## --*the sign of quality*

Now is the logical time for you to go into the question of what new machinery you will require to bring your machine shop equipment up to date, and to place yourself in an advantageous position to handle the volume of trade when conditions open up, and they will open up, probably sooner than is expected. Be prepared.

Why wait until your shop is filled up with rush orders to do this important work? "Do it now."

Need any Lathes? Shapers? Slotters? Drills? Punches or Shears? We are in an excellent position to supply your needs promptly and efficiently.

*Write Us for Full Particulars and Prices.*

P & W

# Pratt & Whitney Taps

**"With the 'Con-eccentric' Land"**

P & W Taps are **good** taps—easily the best where accuracy and high speed are essential. They cost more to buy, but less to use than others.

If you're doing work that calls for big production and for unusual precision, give them a trial. You'll be back for more when you see them prove themselves.

The "con-eccentric" land—the special feature of Pratt & Whitney Taps, permits sharpening on face of the cutting edge without affecting size. It lengthens life and assures accuracy hitherto thought impossible in a commercial tool.

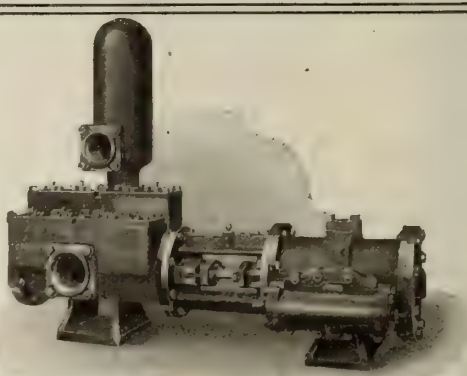
66-68 Fraser Ave., Toronto, Can.

BOWSER Oil Storage GIVES Convenience AND Safety

BOWSER Oil Storage IS Systematic AND Saving



# Hepburn Steam Pumps

### Long Stroke Pumps for High Efficiency

The important thing about Hepburn Patent Pumps is the way they economize in steam. This is brought about by the long, regular strokes and the absence of water in the steam cylinder. Then there are no tappets or levers to get out of order; working parts are few, and the valves are very accessible.

In deciding on your pump then, let these features guide you. We assure you of long service with a minimum of attention from a Hepburn.

Hepburn Products include Vertical Engines, Compressors, Winches, Cut Gears, Derricks, Cranes, Power Presses, Hydrants, Valves, Blacksmith Work and Acetylene Welding.

"The Recording Instrument Idea"

is strongly fixed in the minds of thousands of manufacturing executives. They appreciate the value of keeping in touch with operating conditions, and knowing what transpires during their absence, by means of the chart records furnished by

TRADE MARK
BRISTOL'S
REG. U.S. PAT. OFFICE
RECORDING INSTRUMENTS

Yet, the more important function of "The Recorder" is for the workman who is responsible for the quality of the product. With a "Recorder" installed on the job he can tell at a glance just what conditions are now, what they have been, and in what direction they are leading. With this knowledge he can readily obtain close regulation—and even inexperienced workmen can do better work.

CONTROL THE QUALITY BY CONTROLLING CONDITIONS

SMOOTH-ON ELASTIC CEMENT No3

## Leaks Run Into Dollars

Stopping leaks in flanges and screw-thread joints is the easiest thing Smooth-On Iron Cement No. 3 does. Cracks in pipes, boilers, cylinders, valves—almost any power plant part—can be repaired easily and quickly.

Send for our new Smooth-On Instruction Book No. 18. It illustrates and describes many repairs actually made with Smooth-On Iron Cement. Most of these repairs being described by the Engineers who did the work. Many repairs are unusual, but most of the repairs might be needed in your power plant or boiler room any day.

May we send you a copy of Smooth-On Instruction Book No. 18? It's free, of course.

# Wear out Files —But not Men

It is easier and less expensive to replace files than men.

Keep your workmen supplied with sharp files and they will do their filing jobs well and remain contented.

Let them go on using a dull file, and you may save money on files, but you will lose it on labor and have discontented workmen and poor work.

Replace a dull file with one of the following standard brands:

**Kearney & Foot**
**Great Western**
**American**
**Arcade**
**Globe**

# FILES

# THE JOHNSON FRICTION CLUTCH

## Put Johnson Clutches on Your Machines

The tight and loose pulley is passing from favor. With all its disadvantages, it long survived because a reliable friction clutch was not in evidence.

But in the Johnson Clutch, builders of high grade machinery have found a real clutch service. It has been thoroughly tested and adopted on the finest machines made.

Replace your tight and loose pulleys with Johnson Clutches.

*Single Clutch with Pulley Mounted*

**Write for our Yellow Catalog and Booklet, "Clutches As Applied To Machine Building."**

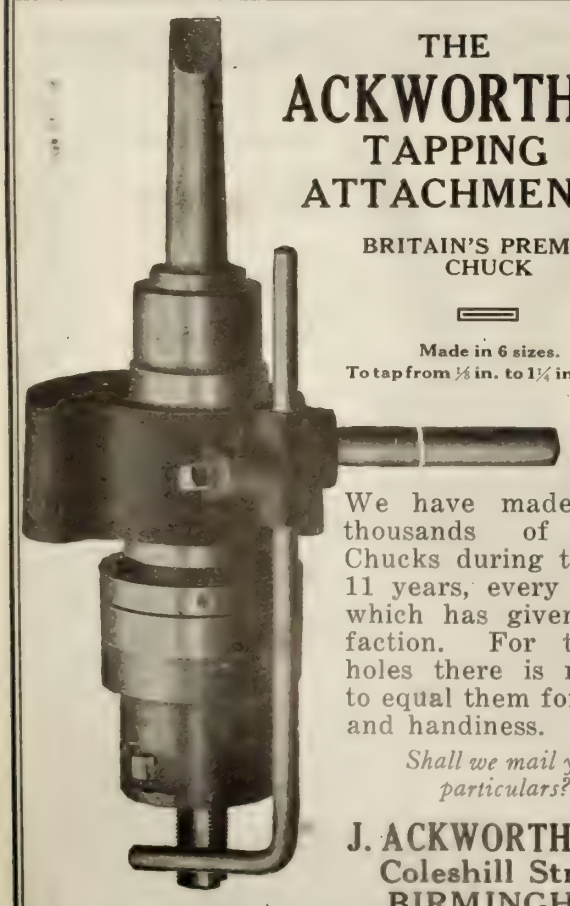
# A Row of Time-Savers!

More pieces per machine is the result of Bilton Gear Miller practice. Their adaptability is almost unlimited on small work such as cutting spur, bevel mitre, angle gears, form cutting and many others.



# Bilton GEAR MILLERS

In Bilton Gear Millers the indexing takes place during the return stroke of the cutter. And the cutter is removing metal 90% of the time. This time-saving feature, coupled with extreme accuracy, has decided hundreds of leading manufacturers in favor of the Bilton for high production on accurate work.

# *If the platform system fits your business*

## *—you cannot afford to be without it*

Jacklift Trucks have perfected the platform system, because they operate in less space, with fewer delays, with less man power, and they stand the roughest usage. Jacklift Trucks save floor space because they lift with the handle at the side, so that no more room is required to lift the load than is required to move the load about. Remember this when buying elevating trucks. The less aisle room you use, the more space you have for production and storage. The aisles need not be wider than the space necessary to pull out the loaded platform into the aisle—usually this is about 15 inches more than the length of the wood platform.

The platform system of moving materials is saving time for leading concerns in the handling of different commodities.

# Producing 900 Float Valve Seats Every Hour

## Automatic Procedure in the Making of Spark Plug Shells, Carburetor Float Valve Seats, Piston Wrist Pins, Transmission Bolts, Sewing Machine Screws, Cylinder Priming Bodies and Nuts in Quantity

By J. H. MOORE

PRODUCTION met in with a real companion when automatic machinery came into being. True, the term automatic machines covers a very wide field, but what we are particularly interested in is automatics as used in the machine tool industry, that is, for production purposes.

There is a story told of an old-time machinist who could not see why these new-fangled machines should be catered to. "The old lathe is good enough for me" was his favorite expression, until one day the boss asked him, merely for a joke, to make 5,000 screws, all of the same size and length. That finished him, and from that day on he saw the force of the argument for production, also the need of some kind of production tool. It's a case of getting out the work as speedily as possible, and in the material to follow we shall illustrate how one concern is helping manufacturers solve their production problems. It is not our intention to compare or comment upon its method but rather to present the data on these jobs to our readers, leaving them to study the same at their leisure. There will doubtless be points brought up that will help solve some other problems, and if so we will be well repaid for our efforts in preparing this data.

### Automatic Screw Machine

First of all, the purpose of this type of machine is too well-known to require detailed comment, and yet there are a few still existent who believe that such a machine is for the making of screws only. Of course, this is an erroneous impression, for briefly such a machine is designed to produce that large class of work which can be made from bar stock, the parts being drilled, formed, threaded, etc., on the bar, and then cut off.

There are various types of these machines but to treat them in detail would take a volume in itself, so for the purpose of this article we have confined our data to one type of machine, that made by the New Britain Machine Co., New Britain, Conn., and to this firm we owe thanks for the data afforded us.

Fig. 1 shows the general appearance of one of these machines, and, briefly, here is a description of its principal parts. As will be noted it consists of six spindles, these being contained in suitable bearings. There is also a spindle cylinder, this being contained in a cylinder housing. An end working tool slide forms part of the machine, its function being self-apparent. Generally speaking, the operations which the machine is adapted to perform in the several positions are as follows:

First position—feeding to a stop, centering and drilling. Second position—box tooling, drilling and rough forming. Third position—box tooling, drilling and finish forming. Fourth position—box tooling, drilling, counterboring, reaming, undercutting, or any end operation. Fifth position—threading, or any other end operation. Sixth position—cutting off.

In the fifth, or threading position,

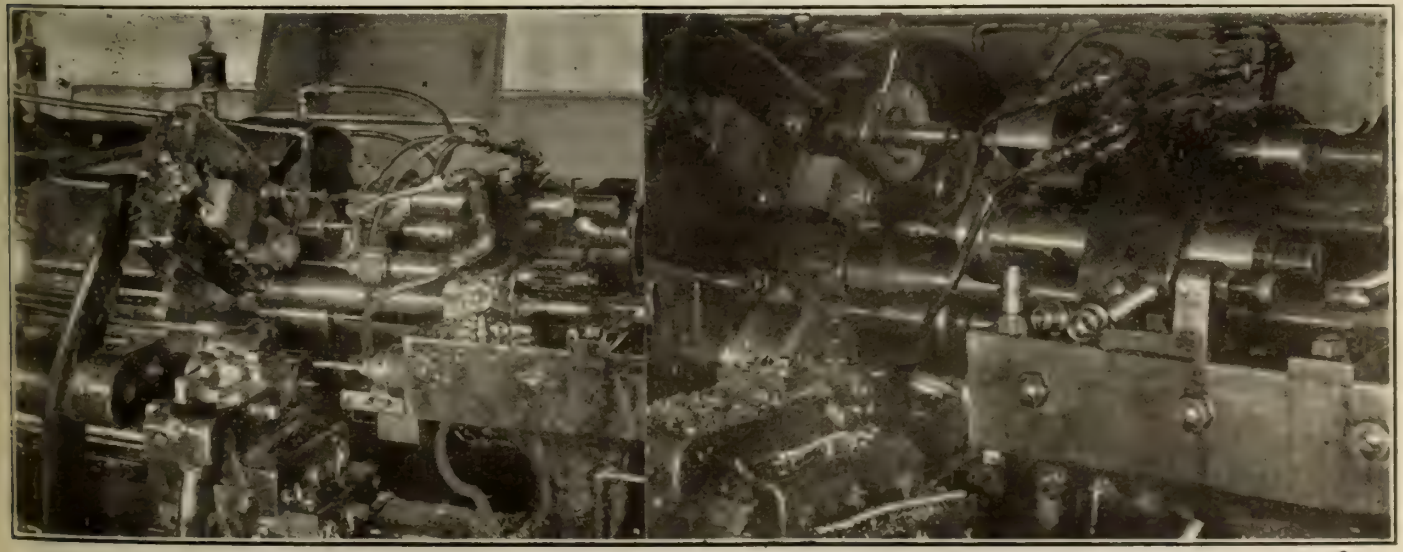

FIG. 2- MACHINING CARBURETOR FLOAT VALVE SEAT.

FIG. 1- PRODUCING A SPARK PLUG SHELL.

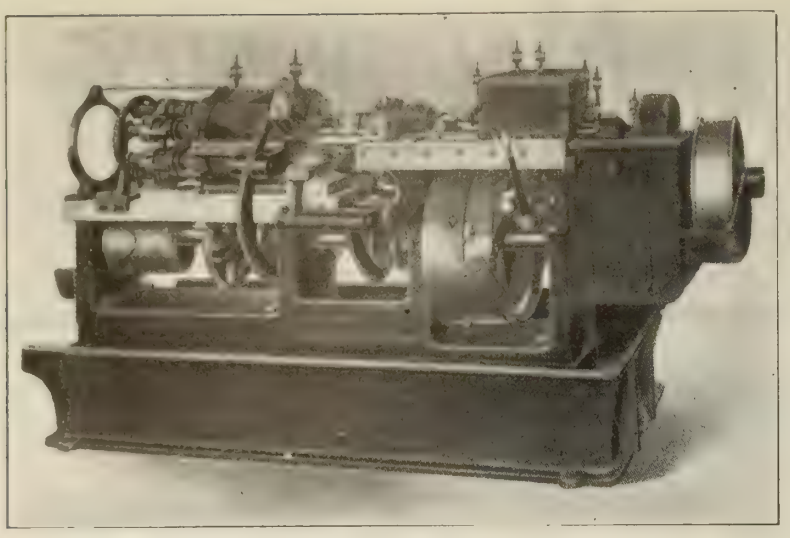

FIG. 1—FRONT VIEW OF A SIX-SPINDLE AUTOMATIC.

there is an extra large tool shank hole which is bushed to the standard size and fitted with a bearing cap. The removal of this cap and bushing makes it possible to take out any spindle, by indexing it into that position, without disturbing the cylinder or tool slide.

The tool slide is operated by a feed cam and drum, these being capable of adjustment for the entire range of tool slide travel. Should an operator wish to stop his power feed, convenient hand levers control these feeds, and they can be stopped instantly.

Two forming slides, in addition to a cut off slide, form a part of the machine, and by the addition of an elevating block to the cut off slide forming can also be done in the fifth position. These slides are independent of each other, the lower one, for rough forming, being mounted on the frame, while the other slide, used for finish forming, is attached to the spindle cylinder housing, and is so placed that its plane is at right angle with the spindle axis.

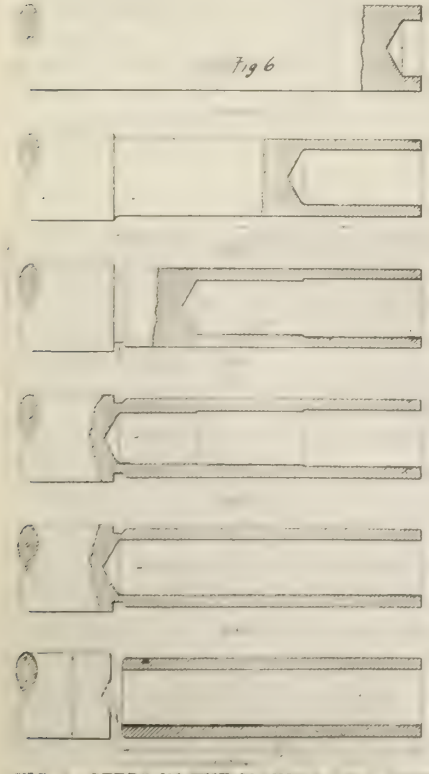

FIG. 6—STEPS IN THE MAKING OF A PISTON WRIST PIN.

### Tools and Attachments

We shall not go further into the design of the machine itself, but will dwell for a moment on the style of tools and attachments used in conjunction with the machine. Six end-working tools are accommodated by the tool slide. The direction of spindle rotation permits of the employment of standard right hand drills, reamers, counterbores, etc., and, of course, this feature means that the majority of tools used are regular stock cutting tools.

Generally speaking, a standard equipped machine consists of two universal adjustable box tools, three adjustable tool holders for tool slide and two forming tool holders. As already stated, forming can be accomplished in the fifth position by using a forming slide extension.

Revolving drilling spindles can be applied in the third and fourth positions to speed up small drills, these being gripped in chucks and running against the direction of work rotation. On short work special drill speeders can be used to run in second, third, fourth or fifth positions. Of course, where necessary, the use of such speeders accelerates production, reduces drill breakage and insures concentricity of hole with outside.

A multiple turning attachment can be fitted to the lower forming slide of such machines, this being designed for work on gas engine wrist pins, or pieces of similar form where the length to be turned is considerable, but the amount of stock removed comparatively small. Four or more cutters are fed in the required depth, after which the tool slide moves parallel with the work approximately one inch. This, of course, reduces turning time, as the work can be finished in one-fourth of the time ordinarily required.

In some cases an accelerating reamer attachment is used for work on whic the drilling is done in steps, the arrang ment being such that the feed and trav of reamer are from two to four tim that of the drills.

The threading mechanism is designe to cut right and left hand threads, a without going into the details of co struction, enough to say it has a tri ping arrangement that permits threa ing practically up to a shoulder. Th only changes necessary for cutting le hand threads are the reversing of pawl in the die holder, and the inte changing of two dogs on the cam dru

It will be noted that we have give no detailed description of these ca drums, but this has been done inte tionally, as what we are after partic larly is examples of work performe

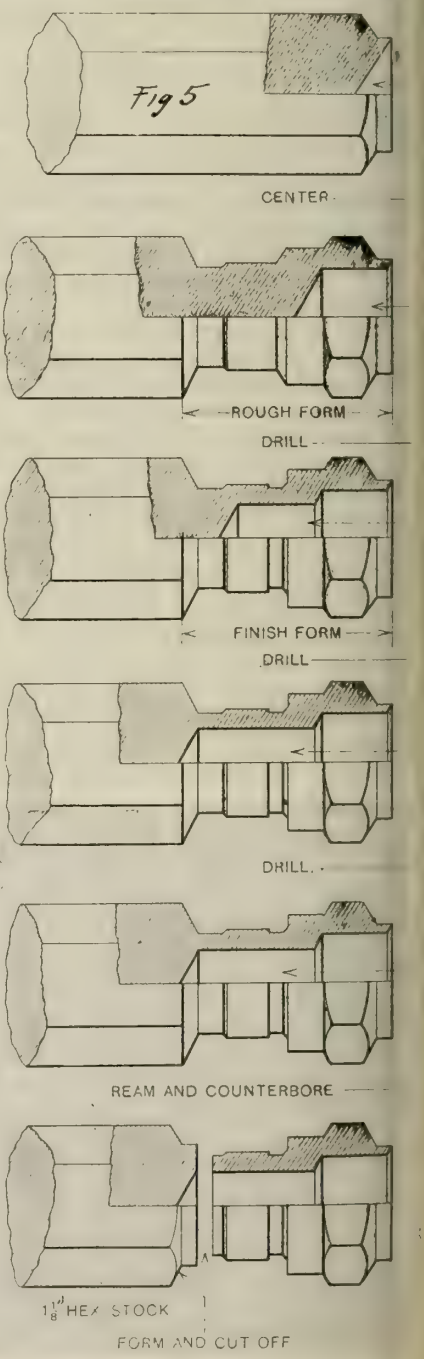

FIG. 5—MAKING A SPARK PLUG SHELL

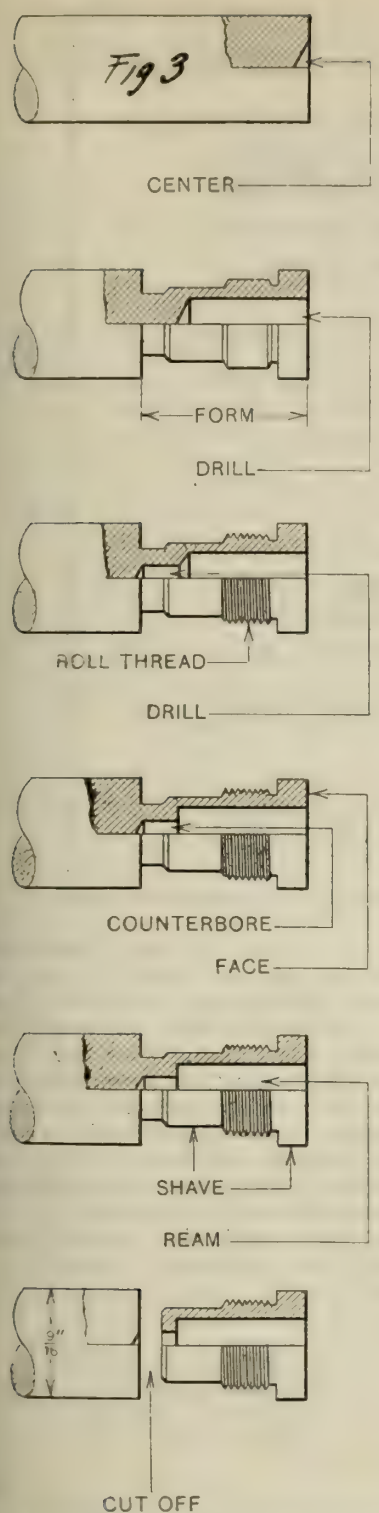

FIG. 3 MACHINING A CARBURETOR FLOAT VALVE SEAT.

not so much the design of the machine, In fact the preceding description is longer than we first of all intended, but the main points could not be told in less space.

### Examples of Work

The first example, Fig. 2, depicts the machining of a carburetor float valve seat, this piece being made of brass. At Fig. 3 is shown the step by step procedure in the making of the part. First the work is centered, then drilled and formed as shown. The thread is next rolled, and at the same position the smaller hole is drilled.

The fourth step is counterboring and facing, while at the fifth position the outside unthreaded portions are shaved to size, and the large hole reamed as shown. The last position is, of course, devoted to cutting off. Nine hundred pieces per hour are produced with this arrangement of tooling.

Fig. 4 depicts the machine set up for producing a spark plug shell, this piece being made from regular screw stock. Again let us follow the different steps at Fig. 5. First comes the centering, then next the drilling and rough forming. At the third position the piece is finish formed, and drilled further in, but to a smaller size. The fourth step is simply a case of drilling still deeper, while the holes are reamed and counterbored at the fifth position. The sixth and last position is devoted to cutting off, and it will be noted from this view that the stock which these pieces are made from is 1⅛-inch hexagon. The production with this arrangement of tooling is 256 pieces per hour.

A good example of deep drilling is shown at Fig. 6. It is interesting to note the steps taken in the completion of this piece, which is a piston wrist pin made of chrome nickel steel. The first step is, of course, centering. The second position is that of drilling for a certain distance in, at the same time turning the outside diameter.

The third step is that of drilling still further with a drill of slightly smaller diameter, at the same time forming the portion shown in sketch. At position four the drilling is continued still further, and at position five this series of holes are reamed. The last step is that of cutting off. The production by this method is 38 pieces per hour.

Fig. 7 shows a transmission bolt in process of manufacture. The material in this case is screw stock, and the first step is that of feeding to a suitable stop. The next position is devoted to forming and turning a certain portion of the bolt, while the third step is that of turning the portion shown in sketch, also the forming of bolt head. Next another portion of bolt is turned, and at the same time the point is chamfered.

The fifth position is taken up with threading, while the last step is that of cutting off. It will be noted that the bolt is made from 9/16-inch stock, and is 3 1/16 inches long when finished. This example demonstrates clearly the advantage of studying the work.

Fig. 8 illustrates some clever tooling on a sewing machine screw. As can be noticed, the first step is that of centering. Drilling and forming are accomplished at position two, while drilling is continued at position three, the knurling of the screw head being done at the same time. Next comes the reaming at position four, while at position five threading is performed. The last step as usual is that of cutting off. This screw is made of regular screw stock, and 180 are produced per hour.

### Some Further Examples

In many cases pieces are of such simple form that they do not require six spindles for their completion. In such instances the tooling can be so arranged to make possible the production of more

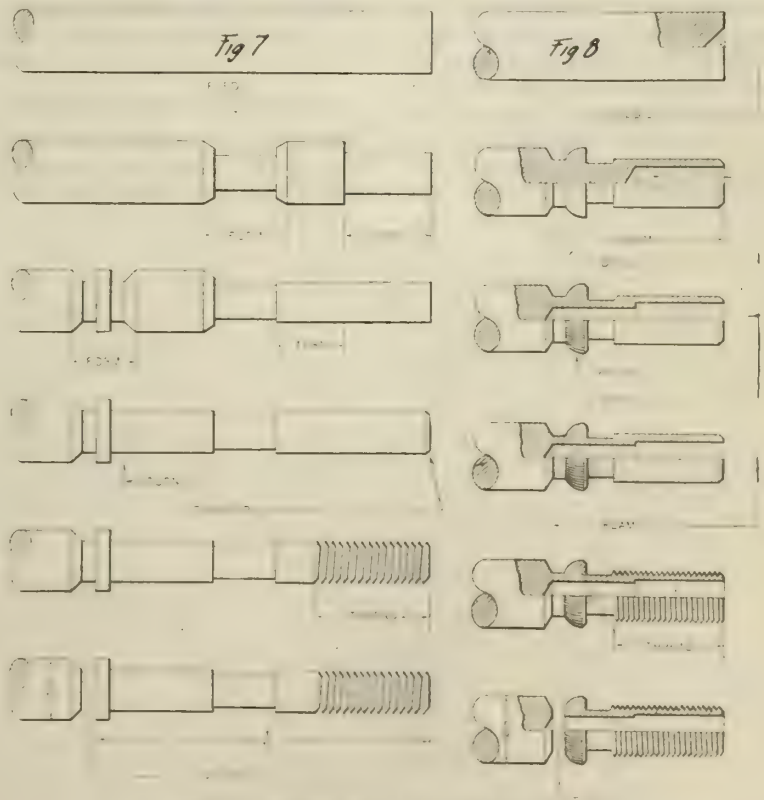

FIG. 7—PRODUCING A TRANSMISSION BOLT.
FIG. 8—MACHINING WORK ON A SEWING MACHINE SCREW.

than one piece at each indexing, cutting off at other positions, usually the third and sixth. Carrying the idea still further, the machines can be arranged to cut off in the second, fourth and sixth positions, thus permitting the handling of work commonly accomplished on single spindle machines—but with trebled production. This is largely a matter of experience, and as one gets more familiar with such machines, improvements on tooling can be made. In fact, when in doubt, it is a good plan to consult the maker of the machine, putting your problem direct. In practically every case they are only too pleased to give the benefit of their experience.

To illustrate the idea of producing more than one piece at each indexing, let us refer to Fig. 9. In this case the piece to be produced is a nut, and note carefully the steps taken. First comes centering. Next, the drilling part way and the forming of three nut blanks. At the third position the first nut is cut off, while the hole is drilled completely through the three blanks at position four. Positions five and six are devoted to cutting off, the second and third nut being cut respectively. It will be noted that the stock is 1⅜-inch hexagon, so that it can be plainly seen, with a little careful planning, production can be increased by efficient method of tooling.

We could go on indefinitely showing examples of work performed, but for the purpose of the article we will show only one more, that being the cylinder primer body shown at Fig. 10. The first step is drilling to the form shown, while rough forming is completed at position two. At step three a smaller size of finish form tool gets in its work. Step four is the drilling of a still smaller hole, while at position five the medium sized hole is tapped. At position six the part is cut off, but before this happens the counterbore is finished as shown. The material from which this piece is made is screw stock and 150 pieces are produced per hour.

These examples will in some measure help readers to size up the method of laying out tooling steps on automatics, and in a later issue we shall describe another type of machine, together with the work performed on the same.

### SCOOP-BODY INDUSTRIAL CAR.

An industrial car of the scoop body type, which can be used singly or as a trailer, has been placed on the market by the Easton Car and Construction Company of New York. A turn-table device, located below the body of the car, permits of revolving the body to any position and dumping from any of the four sides. The truck is provided with wide rim wheels equipped with roller bearings; the front axle is of the swivel type, with a machined cast-iron ball-bearing in the centre. It is adaptable to the handling of castings, machine cuttings, coal, sand, etc., and when used singly can be operated easily by one man.

# Standard Practice for the Small Jobbing Shop

## Practice Suitable for Shop Employing One Hundred Men or Less, the Business Consisting of General Jobbing Work and a Small Amount of Manufacturing—Departments Included: Pattern, Foundry, Machine, Plate and Electrical.

By M. B. SAUNDERS

THE small jobbing shop is neglected by writers on the subject of works management, they usually taking as illustrations the system or method as used by a concern employing a large number of men and it is not always very clear how it can be adapted to a small shop of, say, 100 men, especially if their principal work is of a jobbing nature.

Yet, for every large shop, there are a number of small ones, the managers of which have at some time or another struggled with this difficulty of getting enough system to obtain satisfactory results, without making it too unwieldy and expensive to operate.

The following is a description of a standard practice installed in a shop employing about 100 men, the business consisting of general jobbing work and a small amount of manufacturing. The works consisted of pattern shop, foundry, machine shop, plate shop and electrician shop.

When an order is received, here is the procedure: It is first O.K.'d for credit by the accountant and provided with its shop order number. It is next sent to engineering department, who see that all details are clear; they make out bill of material, arrange for necessary drawings or sketches, all manufacturing data and make out shop order on regular order blanks. They now check and return customer's original order, acknowledgement (green) and office copy (yellow) to general office. They pass on works copies, bill of material and all necessary data to production department.

The production department enters the order in production register, estimates its value, arranges delivery dates, and keep in touch during the progress through the works.

### Sales and Quotations

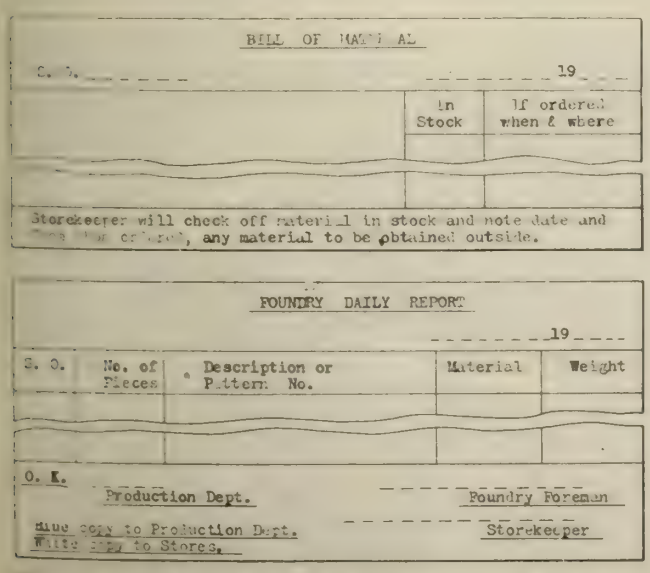
On receipt of an inquiry, the sales department arranges specifications and prices. The engineering department supplies any data, drawings and sketches that may be required, but delivery dates are not made without first consulting the production department.

### Engineering Department

This department passes on all shop orders, prepares necessary bill of material and supplies all necessary manufacturing data before they are passed on to production department. They also take charge of drawings, blue prints and all data. They prepare all drawings and sketches that may be necessary and also prepare preliminary estimates for special jobs and assist sales department when required. They obtain from accounting department each month all cost sheets, so that data may be compiled on all products to facilitate estimating. They also see that all drawings, blue prints, etc., are returned when order is completed.

### Production Department

The production department has general supervision of orders and production. They keep progress register up to date, see that there are no delays, either between departments or waiting for material or instructions. They arrange delivery dates, and inspect all workmanship and material, also reporting to the main office each day all delivery dates that have been exceeded, stating reasons.



### Foremen Generally

The foremen have control of, and are responsible for their own department. Each one will not accept verbal orders and all orders must come through the recognized channels as shown on management and operation charts. All interdepartment instructions and requests must be in writing and be O.K.'d by production department.

Each foreman is held responsible for the work in his department, and he must personally inspect all his work. The fact of a job passing inspection does not relieve him of responsibility in case of error. Each foreman operates his own department to its best advantage, but he must remember that one department cannot be run at the expense of another and that the works must be operated to the best advantage as a whole.

### Pattern Shop Foreman

The foreman patternmaker has charge of patternmakers and carpenters, pattern store, and he is responsible for its condition and contents. When a pattern is ready for the foundry, after being carefully checked, a foundry ticket is made out in duplicate, showing exactly how many castings are required, the

date, S.O. number, customer's name and description. Both these tickets are handed to the foundry foreman. Patterns are sent to foundry and placed in the room provided for them.

After use, patterns must be returned to pattern store.

Upon completion of each order, a requisition must be sent to store covering all material used on that S.O. or in the case of a large order, upon completion of each part or section. The foreman keeps a record of his delivery dates upon his copy of the S.O. and checks them up when he sends patterns to foundry. Patterns arriving from outside sources are delivered to the foreman, who then handles them in the same manner as patterns from their own store.

### Foundry Foreman

On receipt of a pattern (with foundry tickets) he at once checks it and sees that all core boxes, sweeps, etc., are with it. He hands on a duplicate ticket to his leading chipper. After castings have been taken out of the sand and cleaned, the leading chipper enters the S.O. description and weight of all castings on the foundry daily report forms and marks on each castings its weight and S.O. number. After inspecting these castings the foreman O.K.'s the report and passes it on to casting storekeeper not later than 48 hours after the heat. It is important that all castings from any particular heat go on the report for that date. He also issues stores requisition for all material used, this including pig, scrap, steel, coke, etc. He keeps a record of his delivery dates on his copy of the S.O. or foundry tickets.

### Machine Shop Foreman

This foreman has charge of machine shop, blacksmiths and electricians. He keeps a record of his delivery dates on his copy of the S.O. and on completion of orders he notifies shipper and has material moved to shipping point, or in the case of large machinery he requests the shipper to arrange with yard foreman to move to crane or car as the case may be.

### Delivery Dates

Delivery dates are arranged by the production department with the foremen of the departments concerned. The foreman notes on his copy of the S.O. the date promised, and he cannot vary this without first consulting the production department. If it becomes necessary to make a later date, the foreman consults the production department before making any changes in his schedule. Rush orders and breakdown jobs are not accepted for immediate delivery, until such time as production department has arranged any necessary alterations to regular schedule.

### Casting Stores

The foundry daily report must be filled in not later than 48 hours after each heat and O.K.'d by the foreman before being turned over to the casting storekeeper. The storekeeper, when ready to check this report, notifies the production department when inspection is made. Accepted castings are initialed in yellow and rejected castings in red.

After castings have been inspected and O.K.'d the storekeeper signs the report, showing particulars of all castings accepted that day. In case there are more castings than the S.O. calls for, the particulars of the surplus must be entered on a rejected material report, orders for its disposal being issued later.

### Rejected Material

Shop order number and particulars of any material returned as faulty are entered on a rejected material report. Full particulars, the reason, and if the department returning the material makes any claim for labor expended on the particular piece returned, this is all stated and must be O.K.'d by production department. Before this report is sent to main office, the foreman of the department whose material has been rejected must initial the pink copy. The casting storekeeper is responsible for the clearness of these reports. Any castings rejected must be replaced at once, using the original S.O., which must supersede all other shop orders.

### Shipper

The shipper keeps a daily report on the form provided, turning in copies to the accounting and production departments every morning. He obtains from casting storekeeper, machine shop foreman or pattern shop foreman, as the case may be, a notification that the material is ready for shipment. He also turns into main office with this report the pink copies of the shop orders completed, and casting cards, covering these shipments.

When an order is completed, or in the case of a large order, when a part of section is ready for shipment, the foreman of the department concerned will notify the shipper on the form provided.

### Patterns

All patterns must have a number and be entered in pattern register, except in the case of very small temporary patterns. In case customer has a pattern or B.P. No., that number must be stamped on the pattern in a convenient place. In case of standard stock patterns, these carry a number arranged by engineering department. If at any time it is necessary to alter a pattern, after consulting with engineering department and getting alteration O.K.'d, a note is made in the pattern register describing the alteration. This register is kept by foreman patternmaker, engineering department holding a duplicate and keeping it up to date by comparison each month.

### Time Sheets

Time sheets are collected every night

# The Importance of Inter-Shop Transportation

## Study Your Present Trucking System—Secure Definite Figures On Your Handling Costs, Then Ask Yourself "Is This the Best I Can Do?"—Others Followed This Procedure With Great Success.

By J. H. M.

THE importance of efficient transportation can never be over-emphasized. This applies both to long and short hauls, but the short haul, or shall we say the inter-plant haul, is perhaps of the greatest interest to the plant manager, superintendent, yes, and even the foreman of each department.

There still exist unfortunately a few who claim: "No, we don't watch our trucking so awful hard, for after all the men pushing the trucks are non-producers." Others will mumble something about their plant being hardly large enough, but in both cases the excuses are not founded on facts. Instead of looking upon the improvement of their trucking system as an expense, they should view the change from the standpoint of investment. Perhaps the very manager who mumbles that the present system of pushing the trucks by hand is good enough for him never stops to think why he himself uses an automobile. Would he consider someone calling for him each morning with a wheelbarrow and pushing him down to the office? Not much, for apart from the curiosity he would arouse, what he wants is speed. He wants to get there, and to get there without DELAY. It is in this word DELAY that the stumbling block lies. A manager refuses to be delayed himself, but how many allow their goods in the plant to be delayed through lack of proper trucking equipment.

### I Get Enough

It is very seldom you hear an executive say he is getting enough production yet I heard this statement made in a careless offhand manner not so long ago. "Would you refuse an increase?" I asked.

"Certainly not," came the reply, "an increase in production would make lower production costs."

This latter remark is, in a nutshell, the best argument in favor of efficient interplant transportation.

A good method is to start out in this way. First of all ascertain what time is

FIG. 2 THE LIFTING PLATFORM TYPE OF TRUCK IN OPERATION.

consumed on actual manufacture, then find out how much time is taken up in handling. For example, a workman might take 4 seconds to obtain a piece of work, 6 seconds for the actual operation and 4 seconds to dispose of it. This means that 8 out of every 14 is consumed in handling. This is a very average condition. I remember one case in point. A certain product was being drilled, and strange to state for over four years 85 per cent. of the time on this operation was taken up in handling. One day a suggestion was made, and later approved of. By placing a convenient tray at the drill, together with a tin chute to a nearby truck body, resting on a lifting truck platform, production was increased over 100 per cent. This is no uncommon incident, but one of hundreds happening all over the country.

The example related had to do with actual handling at the machine, but how about the increased production, how was that taken care of? Simply by the use of a truck in the shop which was not half busy enough, so in this case additional equipment was unnecessary. Suppose no truck had existed, what would have happened? Part of the operator's time would have been consumed in moving a hand truck, or some other help would have had to push the finished material away, otherwise congestion would have occurred. In either case the added production value would have been overshadowed by the extra help required.

Another case that came to my notice was on the handling of a certain product through a particular department. The handling cost was .59 per thousand pounds, but after a change in the haulage system had been made, this figure was lowered to .12.

### Proper Procedure

On having made up your mind as to the value of efficient transportation, write the firms which handle the equipment you believe will suit your purpose. State your problem frankly, do not make light of it—ask their opinion, also invite them down to look you over, then watch results. Naturally any concern wants a sale, and they will do their ut-

FIG. 1 THIS VIEW SHOWS TO GOOD ADVANTAGE THE USE OF TRUCKS IN THE FORGE DEPARTMENT.

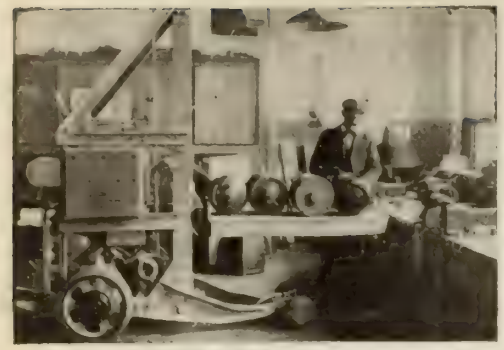

FIG. 3—A CASE WHERE THE TIERING TYPE OF TRUCK COMES IN VERY HANDY.

most to prove to you, where they claim they can save you money.

In speaking to H. S. Powley, of Powley & Townsley, Ltd., who are the sole Canadian distributors for trucks made by the Automatic Transportation Co., Buffalo, N.Y., I asked him if my statement was correct, viz., that manufacturers will give figures and prove them. His answer is worth recording.

"Speaking for my own particular firm, Yes. We not only give figures and prove them, but keep on plugging till we better them. You know, after you sell a battery of trucks, or even a single truck, your work is only started. If you are content to let it rest there, you've merely made a sale, increased efficiency to a stated figure, made a satisfied customer, and then what?

"To my mind you should follow up such problems—help a firm to really get somewhere—and above all prove to them the maximum efficiency of your particular style of truck. Many a truck is not working to 50 per cent. of its efficiency at the present time. Why?—because the improvement at 50 per cent. efficiency is so great over the old method, that the executive never imagines still further haulage can be handled. Let me cite a case.

"At the Canada Steel Co., Ltd., we installed some trucks, guaranteeing a certain figure. We more than covered that figure, and the superintendent was very well pleased, but not so with us. I told him we could do still better, and in a kindly way I was asked if I was crazy. Had I not made my sale, received my money, then why on earth bother further?

"'Because,' I replied, 'I'm going to show you the real value of careful trucking.' I stuck with the job, studied the conditions existing at the plant in question, then started on a little scheme which worked out as follows:

"Getting the truck operator to one side I said, 'How would you like to make more money?' Need I tell you his answer? I next explained that if he were to get another man to help him load and unload he could make more money. I pointed out that he was to be the other man's foreman, always having it understood, of course, that both he and the new man must be under the superintendent. I asked him to pick out his own man, and he did so, with the result that haulage increased another 50 per cent.

"At this point let me say that it does not pay to put any old dub on a truck as operator. A manager of a firm likes to handle his own car, or if he is fortunate enough, he has a trained chauffeur. In like proportion he should not expect a dub to do as good as a capable workman. For example, the operator on the truck I told you about was a machinist before I made him a truck operator. He didn't want the job at first, but when I showed him he could make more money at trucking than at his trade—well—the rest was easy. I always break in a new operator with the truck empty. I show him the movements carefully, then as soon as he understands them, he becomes the chauffeur, so to speak. I never hurry a man, but let him learn the game thoroughly—but wait, you are writing this article, not me." Laughingly he passed over the reins, so again I speak from my own standpoint.

### The Electric Truck

The electric storage battery type of truck is too well-known to require any introduction. There are two general styles in use, first, the carrier truck, which takes its load from place to place, and second, the tractor type, which pulls loaded trucks to any desired department. The principle of design is practically the same in both cases, an electric motor supplied with current from storage batteries doing the driving. Generally the speed of such trucks is so controlled that they cannot travel at more than a predetermined rate. Steering is done by one hand, while the other is on the driving lever. If the driver moves his hand from the lever it immediately returns to neutral and the brakes are applied. However, we are not so interested in the truck design itself, as what it accomplishes, so let us get to some examples of work performed. The following figures were kindly given us by Mr. Powley, and apply to trucks as made by his concern.

First of all, let us study Fig. 1. Here

FIG. 6—THIS VIEW SHOWS ELECTRICAL CONTROL OF A TYPE "T" TRACTOR.

FIG. 5—A TRUCK OF THIS STYLE SAVES MANY A MAN'S BACK.

is shown one of four trucks used by the Massey-Harris Co., Toronto, for hauling material throughout their plant. The truck shown is of the tractor type, and is at present pulling two long hand trucks filled with angles and channels. This concern tells us that not only have the trucks proved of value for speeding the work through the plant, but they have helped to keep all aisles clear in the different departments. Briefly, they wouldn't be without them. They also use the lifting platform type of truck for other purposes, and have another tractor type at their plant in Brantford, Ont. Fig. 2 shows the lifting platform type truck in operation.

Then there is the tiering type of truck. Its uses are varied, but the view shown at Fig. 3 is ideal from a machine shop standpoint. Here we see the work raised to the proper bench level, and all that remains to do is push the work on to the bench. Another good illustration of the same type of truck is shown at Fig. 4. Here is a condition often met with. A high platform level, yet the difficulty is removed without trouble with a truck of such a nature. Lifting castings from the floor or yard is easily accomplished with a truck of the style shown at Fig. 5. Up goes the work on the crane, on to the truck, a pull on the handle and away goes the truck to the desired department.

At Fig. 6 is shown the electrical control of a type T tractor and while we will not go into detail of the mechanical features, enough is seen to appreciate the compactness of the arrangement. We could go on indefinitely illustrating uses for inter-plant trucks, but enough has already been shown to prove their value. For this reason we will content ourselves with one more view, that shown at Fig. 7. This depicts a type AA industrial engine hauling a load of coal. Note that the engine is equipped with a tilting hopper, this making for speed in unloading. The value of such an arrangement is self-apparent, and without going further it is safe to say that such trucks can be made with all types of bodies designed to suit every conceivable kind of material flat or otherwise.

Should readers imagine the examples already quoted to be mere flights of fancy I might say that the names of the

FIG. 7 HAULING COAL IN THIS MANNER REDUCES EXPENSE.

firms using these trucks are available if required, and this is also true of the figures to follow, which are statements made by concerns as to conditions as they have found them, these, of course, dealing with electric trucks of the make already mentioned.

A plant superintendent states, "We are saving $15,000 a year in wages alone as a result of the installation."

A factory manager says, "We find that we can move as much material with one truck as twenty-three laborers."

Another general manager states that he saves $12,000 yearly, and a superintendent who devotes his time to inter-plant transfer claims that he has reduced confusion and lost motion, and in addition is approximately saving $30,000.

An assistant superintendent mentions that in place of 44 men he uses two, and that he handles his product 100 per cent. faster than formerly.

Another concern reduced their trucking staff 80 per cent., yet get better results. We have used an electric truck 40,000 miles, and its still going strong, writes another.

Here briefly are some other savings: $12,000 yearly, $9,000 yearly, $10,000 yearly, one truck alone saves $4,000 yearly, and one concern goes as far as to say eight horses and eight men were replaced by four trucks.

Surely there must be something to all this? Managers and superintendents do not waste wind telling of things that do not happen. Have you a truck problem? If so, investigate, for by so doing you will save time, worry and considerable cash. The question of inter-plant haulage is a vital one. Give it the attention it deserves.

## STANDARD PRACTICE FOR THE SMALL JOBBING SHOP

(Continued from page 30)

between 4.30 and 5 p.m., a new time sheet being left with each man for the following day. The foreman sees that these sheets are filled in at intervals during the day and not left till the last minute, when proper distribution of time is not always possible. The sheets are collected and delivered to timekeeper's office every morning not later than 10 o'clock.

Each of these standard practices is typewritten on a separate sheet, clipped together in a folder and a copy supplied to all department heads and foremen, which, together with the operation and management charts, which are prominently displayed in the main office and works office, make all routine work and operation in connection with the management of the works quite clear.

The idea is to elaborate this by adding additional ones, covering any important subject that may necessitate a standard practice.

Of course, it is important that before a standard practice is put into force, it should be very carefully discussed with all concerned and an opportunity made for suggestions.

When once it is finally agreed upon and becomes law, it should not be deviated from, except under instructions from the manager or some other appointed official, when, if necessary, the practice concerned should be rewritten to cover the new conditions.

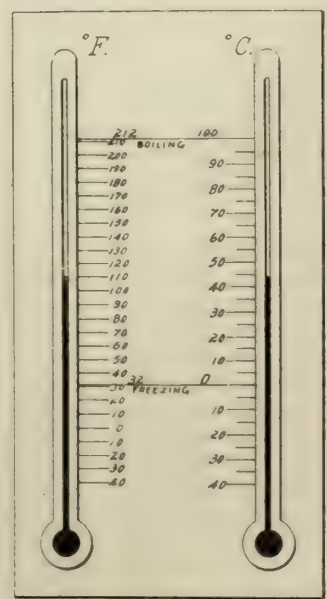
The production department register will enable the production superintendent to keep in touch with his orders with the minimum amount of trouble. The procedure is this: When an order is received from the engineering department, it is entered up and delivery date fixed. By checking up each day with the shipper's report and the foundry report, together with personal observation and inquiry, the superintendent is able to see which orders are lagging or where dates require rearranging.

If alterations are made with heavy blue pencil, and orders completed are scored off with red pencil, it becomes quite easy to pick out the unfinished orders. The writer has found that in the small works it is better to have this register in book form rather than on cards. Of course, it is absolutely necessary that no delivery dates be made by any other official, and any changes in schedule must be arranged with the production department.

Two new industries have decided to erect plants in Hamilton, Canada—the Fuller Brush Company, of Hartford, Conn., which will employ about one hundred hands, and the Coffield Washer Company, which will employ about fifty hands at the beginning.

# *TEMPERATURES*

## *CENTIGRADE AND FAHRENHEIT SCALES*



In mechanics and engineering it is often desired to convert temperatures from one scale to another or to find the relative equivalents. On the F. scale the freezing point is at 32 degrees, while on the C. scale it is at zero. The boiling temperature on the F. scale is at 212 degrees, and on the C. scale it is at 100 degrees. It is then evident that on the C. scale the temperature range between freezing and boiling temperatures is 100 degrees, while by the F. reading the range is 180 degrees; that is, a rise in temperature of 9 degrees on the F. scale would correspond to a rise of 5 degrees on the C. scale.

To convert a C. reading to Fahrenheit—multiply the C. temperature by $\frac{9}{5}$ and add 32.

Thus:—$60° \text{ C} = \left(\frac{9}{5} \text{ C}\right) + 32 = \left(\frac{9}{5} \times \frac{60}{1}\right) + 32 = 140 \text{ F.}$

To convert an F. reading to Centigrade—subtract 32 from the F. reading and multiply by $\frac{5}{9}$

Thus:— $100° \text{ F} = \frac{5}{9} \times (\text{F} - 32) = 37\frac{2}{3}° \text{ C.}$

$$F = \left(\frac{9}{5} \times C\right) + 32°$$

$$C = \frac{5}{9} \times (F - 32°)$$

*Canadian Machinery*

# Tool Steel Used in Making Miscellaneous Tools

## Using High Carbon Open Hearth Steel for Various Kinds of Tools—Composition of Such Steels—How to Obtain Best Results —Heat Treatment Important—Such a Steel Only Has Its Place

By GEORGE PORTEOUS*

THIS subject should be of general interest because of the fact that the purchase of tool steel for general tools, such as hand and pneumatic chisels, shear blades, etc., is a large item in the yearly expense bill of many manufacturing concerns. The substitution of high carbon open-hearth steel in place of the more expensive crucible tool steels in the manufacture of these classes of tools is not a recent departure from established practice, but this subject in the past has not received the serious consideration which it merits.

It is axiomatical that the quality of open-hearth high carbon steel can not be compared fairly to that of the more carefully made electric and crucible tool steels, therefore, it is obvious that the forging and thermal treatment of the lower grade steel must be studied carefully in order to compete against the higher grade steels in the manufacture of miscellaneous tools.

I have often noticed advertisements of special tool steel made into punch and chisel form, driven through steel blocks of from 1 to 2½ inches thick. These illustrations purport to show that the steel from which the punches and chisels were made is of special quality and far ahead of any ordinary tool steel. As a matter of fact, this is not to my mind a quality test at all. A sample of high carbon open-hearth steel can be made into a similar punch, and be treated and drawn through a 3-inch block of medium carbon steel.

From the foregoing we learn that high carbon open-hearth steel can be so treated that it will equal the durability of a so-called superior grade of steel by means of careful and intelligent treatment, and we can also realize that this characteristic also opens up a very large field of usefulness by the substitution of this steel in place of the high grade steels in the manufacture of many kinds of tools.

We have been using high carbon open-hearth steel as a substitute for tool steel for several years and we have been successful in its treatment for such tools as cold chisels, rivet snaps, punches and dies, taps, shear blades, and similar tools. The grade of steel that has proven most successful in the manufacture of these classes of tools has had an analysis of approximately 80 to 100 per cent. carbon, less than .03 phosphorus, less than .03 per cent. sulphur and .35 to .45 per cent. manganese.

### Getting Results

To get the best results for a steel of the above composition, great care is necessary in the heating and forging operations as well as in the subsequent thermal treatment. The billet from which the steel is drawn down should be at least twice the diameter of the finished forging. For example, ¾ to 1-inch octagon should be forged from not less than a 1½-inch bar or billet. The forging temperature should be from 1,800 to 1,950 degrees Fahr., reheated as required depending upon the rapidity of the forging operation and the dimensions of the finished bar. As the forging approaches the final stages, the hammering should become more rapid with lighter blows to finish the forging of the steel at a temperature of about 1,350 degrees Fahr., which refines the grain and leaves the steel in better condition for the subsequent heat treatment.

#### POINTS BROUGHT OUT

That the purchase of tool steel for general purposes, such as hand and pneumatic chisels, shear blades, etc., is a large item yearly, therefore any possible chance of economizing should be taken advantage of.

That high carbon steel can be so treated that it will equal the durability of a so-called superior grade by means of careful and intelligent treatment.

That high carbon steel is used with success as a substitute for tool steel in the making of tools, such as cold chisels, rivet snaps, punches and dies, taps, shear blades and similar tools.

The refining and equalizing process of steel treatment as applied to the forge and heat treatment of percussion tools such as cold chisels, hand and pneumatic, made from open-hearth high carbon steel is applied to the steel in several progressive stages, the success of each stage of the treatment depending upon the proper carrying out of the preceding one.

The first stage in the evolution of a cold chisel is the forging operation which in order to ensure success in the finished product must be done intelligently and with due attention to the proper forging temperature. The steel should be heated high enough to be in a thoroughly plastic condition, approximately 1,850 to 1,950 degrees Fahr. The closer the heat is to the higher temperature the better, so long as a reducing and not an oxidizing heat is obtained. At this stage it is well to remember that when forging the point of a chisel, the edges should not be hammered after the point has been forged thin, because if the steel has been thoroughly worked down to a thin edge on the flat and then turned up and hammered on the edge, the force of the hammering will affect the grain of the steel on the edges but will not penetrate to the center, thereby causing the grain structure of the steel to be uneven. This will cause the steel to develop water cracks when hardened.

The proper method of forging the point of a chisel is to work the steel down to a square taper, as in the forging of a diamond point chisel and then flatten out to the desired width. A little practice will enable a person to gauge the amount of stock required to forge the point of a chisel so that there will be little, if any, grinding to do on the edge. The rough point of the chisel should be trimmed off with a hot chisel immediately following the forging operation when the steel is at a cherry red heat. If necessary the chisel should be reheated.

The second or refining stage of the treatment is done by light blows with a hand hammer, the face of the hammer being dipped in water once or twice during the operation, on the flat of the chisel point when at a dark blood red heat.

The third stage of the treatment is the equalizing of the steel at the point of the chisel. The steel should be allowed to cool down to about 750 degrees Fahr., when the red disappears in the dark, dipped in black oil, withdrawn, and allowed to cool down slowly to atmospheric temperature. The oil should be at a temperature of about 125 degrees Fahr. for this purpose.

If the forging, refining and equalizing operations as just explained have been followed carefully, the grain structure of the steel will be in a state of equilibrium and in perfect condition to be hardened and tempered.

The hardening temperature should be the lowest possible consistent with the holding of the martensitic condition of the structure when heated over the decalescent point of the steel. This would be about 1,425 degrees Fahr. The point of the chisel should not touch water after the first chill. Check the rising temperature in oil when drawing temper by the color method. If an oil tempering bath is used, the temperature for this class of tool would be 490 to 500 degrees Fahr. for a period to be determined by the character of the work to be performed.

In cases where the structure of the

*Supervisor of forge and heat treatment, Minnesota Steel Co., Duluth, Minn.

steel at the points of cold chisels and kindred tools has been impaired by reason of overheating or cold working, it is possible to restore the steel to its original state by upsetting and rewelding the part affected, using a flux of common dry yellow clay. This flux prevents the atmospheric oxygen from finding its way through the pores of the metal and combining with the carbon, forcing the crystalline grains apart, and destroying their cohesion when heating the steel to the high temperature necessary. This, with the subsequent thorough hammering and working, will restore the steel to its original state. The shanks of pneumatic chisels are treated by being heated to 1,450 degrees Fahr., dipped all over in cyanide of potassium, and cooled in oil with no further treatment.

Many of our scientific steel experts will be shocked at the crudity of the above treatment, nevertheless it is the only treatment that gave maximum service on the shanks of chisels used by us for the chipping of hard steel billets.

### Adaptability

The adaptability of using high carbon open-hearth steel in the manufacture of pneumatic chisels for chipping hard steel has been tested very thoroughly in the chipping and dressing of shell steel bars and billets. We have tested it against some of the more expensive steels on the market and it has given us just as good service as these high grade steels and as a consequence we have adopted high carbon open-hearth steel exclusively for this class of tools.

The approximate analysis of open-hearth high carbon steel for taps and reamers should be approximately the following: .90 to 1.10 per cent. carbon, not over .02 per cent. phosphorus, not over .02 per cent. sulphur, and .25 to .35 per cent. manganese. The steel should be forged at a temperature of 1,750 to 1,900 degrees Fahr. annealed at 1,425 to 1,475 degrees Fahr. in a muffle furnace or in covered receptacle to prevent access of air, or withdrawn when the proper temperature has been reached and covered with dry lime or ashes.

When the tools have been rough machined they should be equalized as described in a former paragraph. This equalizing process acts as a preventive to the warping of the tools in the subsequent heat treatment. The hardening temperature of this grade of steel is 1,400 to 1,425 degrees Fahr. To obtain maximum cutting qualities combined with toughness and resistance to shock, the best method of hardening treatment is to hold the tap or reamer in the water just long enough to harden the teeth or cutting faces and then immerse quickly in oil and allow the center of the tool to cool down slowly. The oil immersion allows the hard surface of the tool to heat up enough without losing hardness to take care of the cooling strains which would be liable to crack the tool if allowed to cool off entirely in the water.

### HINTS OF VALUE

When forging the point of a chisel work the steel down to a square taper, as in the forging of a diamond point chisel. After this is accomplished, flatten out to the desired width. The rough point should be trimmed off with a hot chisel immediately following the forging operation. When the steel is at a cherry red heat the third stage in the chisel's treatment is the equalizing of the steel at the point. The steel should be about 750 degrees and the oil about 125 degrees.

The approximate analysis of open-hearth high carbon steel for taps and reamers should be approximately .90 to 1.10 per cent. carbon, not over .02 per cent. phosphorus, not over .02 per cent. sulphur, and from .25 to .35 per cent. manganese. The steel should be forged at from 1750 to 1900 deg. Fahr., and annealed at 1425 to 1475 deg. Fahr. in a muffle furnace, or some covered receptacle to prevent access of air. Should this be impossible the work can be withdrawn when the proper temperature has been reached, covering the parts with dry lime or ashes.

The drawing temperature is from 400 to 425 degrees Fahr.

The analysis of high carbon open-hearth steel found to give the best results in the manufacture of shear blades for cutting cold metal such as steel plate and bar stock is within the following limits: .85 to .95 per cent. carbon, not over .03 per cent. phosphorus, not over .03 per cent. sulphur, and .30 to .45 per cent. manganese. Steel that has been forged for shear blades should be annealed at 1,450 to 1,500 degrees Fahr., heated evenly in a muffle furnace and allowed to cool down with the furnace.

The hardening temperature is 1,425 to 1,450 degrees Fahr., chill in water and allow to remain in the bath long enough to harden the exposed surfaces, then transfer to an oil bath and allow to cool down in the oil, draw in oil tempering furnace to 490 to 500 degrees Fahr. Allow the blade to remain in oil tempering furnace long enough to ensure thorough toughening. A shear blade of the following dimensions, 1½ x 7½ x 24 inches, should be allowed to remain at the proper drawing temperature for a period of at least two hours.

To secure the best results in service from a high carbon open-hearth shear blade, the center of the blade longitudinally through the hole centers should be left as soft and tough as possible by being protected from the action of the quenching medium. This can be done by putting a bolt through each bolt hole with a washer on each side of the blade and the bolt and washer luted with clay. In the case of large size shear blades, the best method is to use two flat strips ⅜-inch thick and of suitable width, drilling holes in the strips to match the holes in the shear blades, luting with clay and holding them in place with suitable bolts. Care should be taken that the strips do not cover the cutting edge of the blade. In the case of a shear blade 9 inches wide, the strip should be 4½ inches wide. We have never had a shear blade to break either in hardening or in service when protected in this manner.

I have already mentioned that the punch test is not an indication of the superior quality of the steel from which the punch is made, but is rather a problem in heat treatment. This drive test can be made by using either open-hearth high carbon or regular crucible tool steel.

High carbon open-hearth steel can not be made to take the place of high grade crucible steels for certain classes of tools such as some forms of milling cutters and intricate blanking dies because the cost of the workmanship in making and finishing these classes of tools overbalance the first cost of the steel to such a large extent that it would not be justifiable to use anything but the very highest grade of special alloy steel in their manufacture, but high carbon open-hearth steel can be used in the manufacture of tools some of which I have enumerated, and will give just as much satisfaction in service as the higher grade steels. There is another point in favor of the use of open-hearth high carbon steel as against the crucible steels and that is the difference in price. The cost of open-hearth steel is around 3 cents and crucible steel from 12 to 17 cents per pound. This considerable difference in price should be an incentive to the more general use of open-hearth high carbon steel. I have investigated this matter thoroughly and can guarantee that just as good results can be secured by the judicious use of open-hearth high carbon steel with the proper heat treatment as can be secured from the use of a higher grade and more expensive tool steel.

## NOVEL USE FOR TRACTORS.

A sudden strike among the employees at the electricity station in a British town interrupted the supply of current to the local factories and thus brought them to a standstill. Help came, however, from an unexpected quarter. One of the factories was engaged on the mass production of tractors for agricultural and other purposes; and within a few hours a number of tractors were employed to supply the necessary power in this factory. Twelve tractors were belted up to a shaft from which several motors were driven as dynamos, this novel installation giving an average output of two hundred horse-power. Other tractors were used to drive machines directly. When the news of this got about, demands for the tractors came from other factories, and the emergency service so provided greatly discounted the effect of the strike.

# Uses of Creosoted Wood Block Factory Floors

## Material Used—Problems Encountered—Conditions Met With in a Successful Installation—The Requisites for Success—How to Lay Floors Subjected to Moisture

By LAMBERT T. ERICSON*

THE use of creosoted wood blocks for factory floors has been so extensive during the past few years that it is hardly necessary to go into details in regard to the advantages of this type of flooring. Most engineers and architects have come in contact with this material at first hand, so that we will confine ourselves to a discussion of (1) the material used; (2) the problems encountered; and (3) the field covered.

Southern yellow pine has been employed almost entirely for this work, except on the west coast, where Douglas fir and tamarack are used. Long-leaf pine is usually specified, but short-leaf pine is also adaptable for the work. The lumber should be thoroughly air-seasoned before being cut into blocks, and then should be given a preservative treatment with coal-tar creosote oil to preserve the wood from decay. Hard woods, such as gum, beech and maple, can be used, but they are not favored on account of the difficulty in properly seasoning the lumber and the tendency of the blocks to warp and check after they are cut. The coniferous woods are more homogeneous in grain and texture and are consequently more adaptable. Soft wood compacts under service and consequently it is just as serviceable as hard wood, and has the advantage of not becoming slippery under traffic.

It should be understood in the beginning that factory flooring with creosoted wood blocks cannot be grouped under one general heading and specification. The conditions under which the floor is to be used must first be studied and the specifications made to suit. Creosoted wood blocks can be laid to meet practically all factory conditions if the conditions are first properly analyzed. The real reason for most of the trouble encountered with this type of flooring is the fact that wood expands and contracts with various conditions of the atmosphere and the moisture content of the blocks. It is therefore necessary to lay the individual blocks in such a way as to allow for this change in volume, which in extreme cases may be as much as 5 per cent. The individual units in the floor must be bound tightly in place with a binder which will allow this expansion and contraction and which will exclude water from the underside of the floor. As long as the blocks are held tightly and firmly in place and a smooth surface is maintained the floor will wear almost indefinitely, but as soon as they become loose and the surface rough they will break up into sticks very quickly.

*From "Mechanical Engineering."

### Conditions to be Met in a Successful Installation

The three most essential requisites for success are: (1) thoroughly air-seasoned lumber; (2) a smooth, solid foundation base; and (3) a waterproof and elastic binder to hold the units in place. In the majority of cases factory floors are dry most of the time; consequently, the lumber should be thoroughly seasoned, in order to keep the shrinkage to the minimum. Blocks cut from green or semi-dry lumber will shrink in volume to such an extent that they will often have to be taken up and relaid. If it is possible to do so, it is advisable to use a concrete base for the installation of these floors. The base should be strong enough to carry the entire load and should be finished smooth and level so that it will not be necessary to use a cushion between the concrete and the blocks in order to secure a level floor and uniform bearing for the individual units.

**THINGS TO REMEMBER**

Creosoted wood blocks can be laid to meet practically all factory conditions, if the conditions are first of all properly analyzed.

The chief point is to hold the blocks firmly in place, presenting a smooth surface. As long as this condition exists the floor will wear almost indefinitely.

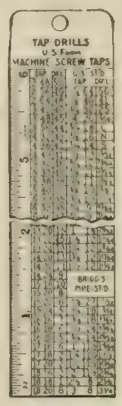
The three important requisites for success are: 1. Thoroughly air-seasoned lumber; 2. A smooth, solid foundation base; 3. A waterproof and elastic binder to hold the units in place.

Floors which are to be subjected to considerable moisture, or to weather conditions, should be laid with ample provision for expansion.

Wherever a cushion is necessary between the concrete and the blocks, it is advisable either to use a mixture of portland cement and sand or a bituminous mastic. The latter is preferable in a great many cases on account of being both waterproof and elastic. It is standard practice to-day to lay the blocks directly upon a smoothly finished concrete without any cushion whatever. It is also customary to give the base a thin, even coating of coal-tar pitch before installing the blocks, so that the underside of the blocks may be thoroughly sealed and made waterproof.

The elimination of cushions and the use of a successful waterproof binder in the joints of the blocks, thereby eliminating the possibility of shifting of the base and a loosening of the units, has permitted a reduction in the depth of the blocks used. Factory floors are now being very successfully installed throughout entire manufacturing plants with blocks as shallow as two inches in depth.

Successful installations may be made on timber and plank foundations in mill-type buildings, but care must be taken to see that the timber in the foundation is sound and that the blocks are afforded a firm and even footing. A bituminous-mastic cushion between the planks and the blocks is now being extensively used and is proving very successful.



Creosoted wood-block floors are being installed in machine shops, forge shops, foundry molding and core rooms, casting cleaning and chipping rooms, warehouses, leather and paper mills, automobile assembly plants, garages, loading platforms, etc. The conditions in the above work vary from extremely dry to a saturated moisture state. They also vary from low to high temperatures, and in some cases the blocks are submitted to the action of molten metal. The extreme variation in the demands covered by the above list of industries gives a fair idea why it is necessary to study the individual job at hand and draw a specification to meet the particular work.

For ordinary factory purposes the proper treatment for the blocks is six pounds of creosote oil per cubic foot of timber. This is injected by the Reuping process and is sufficient to preserve them from decay. When they are to be subjected to considerable moisture or to the weather, they should be treated with twelve pounds of oil per cubic foot of timber by a combination of the empty- and full-cell processes. This extra amount of oil insures better waterproofing of the blocks.

Floors which are to be subjected to considerable moisture, or to weather conditions, should be laid with ample provision for expansion. It is good practice to provide ample space between the individual units to take care of this expansion. These joints should be flushed full of a waterproof, elastic binder, which should preferably be coal-tar pitch of a consistency which will not soften up under atmospheric or room temperatures. Coal-tar pitch has proven the most successful binder and filler for creosoted wood blocks, as it is a derivative of the same base as creosote oil, and thus readily unites with the oil in the blocks.

# Have You Tried This Contest Yet? If not--- Do so Now

Below will be found twelve references to advertisements in this number. To the sender of the first correct set of answers to these we will forward one of these scales.
To win one is not difficult, and at the same time you will add to your store of knowledge. Read the details given below.

The scale is 6 in. long and is made from finest quality steel. One side is marked in 32nds, the other side in 64ths. A table of decimal equivalents is also stamped on one side, and a table of tap drill sizes on the reverse side. This scale is well worth securing.

## What You Have to Do

We publish every week a number of interesting facts or statements selected from the advertising pages for that week. The selections for this issue are given below. Read these through, then turn to the advertising section and see if you can pick out the advertisements to which they refer. The work is interesting, it will train your powers of perception and of memory, it costs you nothing, it will make you better acquainted with the various lines of machinery and tools in the market, and with perseverance you are bound to win one of these useful scales as a prize.

This week V. L. Arnott is the winner. Three other readers forwarded correct lists, but lost out in the elimination test, these being John McGachie, Jr., Woodstock; George Land, Peterborough, and Chas. E. Mars, Brantford.

**CONTEST FOR APRIL 14TH ISSUE**

**Contestants are required to write us, stating to which advertisements we refer in this number.**

1 How to save floor space.

2 Something that has a push button control.

3 How to solve the problem of handling small lots of various shapes and sizes.

4 Something that is designed with a thorough understanding of present day requirements.

5 Where to get something for any purpose or pressure.

6 How to economize in steam.

7 Something that will appeal to those interested in furnace design.

8 How to obtain close regulation of what?

9 A case where a hollow milling tool proved well worth while.

10 Something that is easier and less expensive.

11—How to secure three important features, these starting with L, G, and I, respectively.

12 Something that acts as an incentive.

**These are Correct Answers for List from March 24th Issue:**

1—Nicholson File Co.

2—Hamilton Gear & Machine Co.

3—Imperial Oil Co.

4—La Salle Tool Co., A. R. Williams

5—Roelofson Machine & Tool Co.

6—Skinner Chuck Co.

7—International Business Machines Co.

8—Cleveland Pneumatic Tool Co.

9—Kearney & Trecker Co.

10—Aurora Tool Works

11—Shore Instrument Co.

12—Trahern Pump Div., George D. Roper Corp.

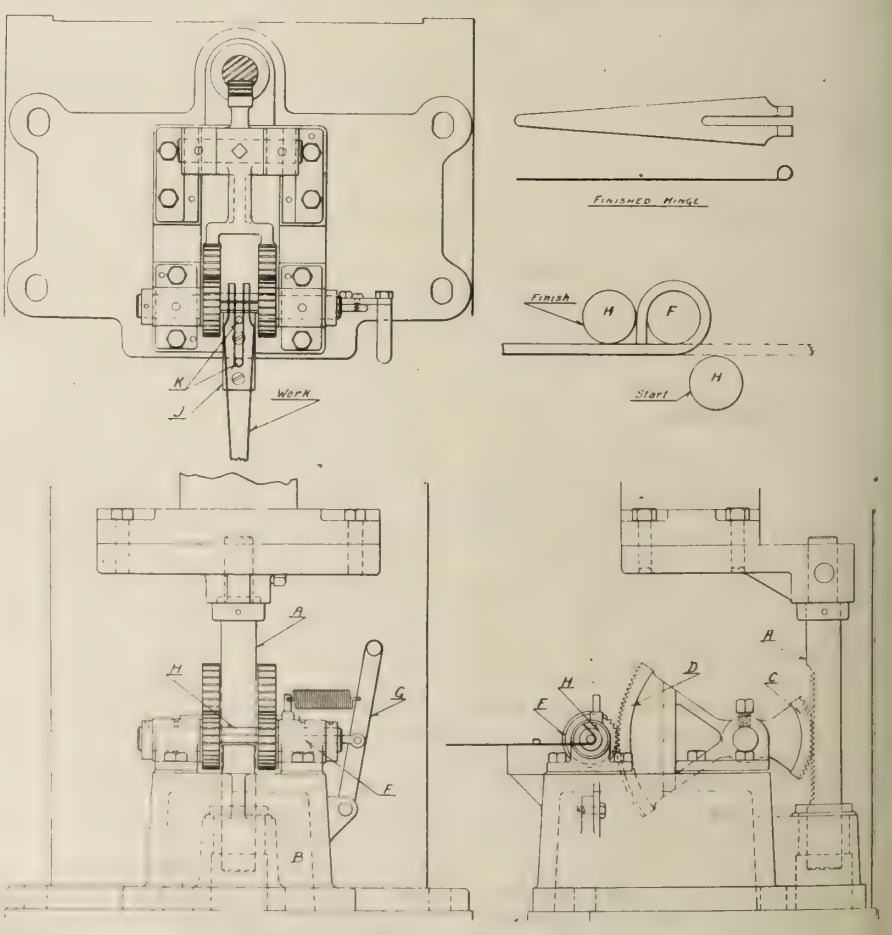
## Closing Date for This Contest is May 5th

# WHAT OUR READERS THINK AND DO

## EYE BENDING FIXTURE

By L. GEORGE

THE drawings herewith illustrate a fixture used in the forming of the double eye on hinges of about 9-32 inch diameter on the forked end of the piece shown. The material is blue annealed sheet steel of No. 14 gauge, and the operation is performed on a light power press of 3-inch stroke. Attached to the ram of the press is an upper bolster having a rear boss that carries the upper end of the round steel plunger A. A nut on the threaded part below the boss allows of vertical adjustment and takes the upward thrust. The lower end of the plunger slides in a steel bushing set into the lower bolster. The middle portion of the plunger is milled away for the cutting of a rack, this having 15 teeth of 10 pitch, with a face of about one inch wide. This rack drives the short end C of a double quadrant which rocks about a fulcrum in detachable bearings. The large end D of the quadrant is forked to straddle the work, the sector of each fork having teeth to mesh with the pinion E, each of these pinions has its own trunnion, bearing and collar. The right hand trunnion is bored to take the 9-32 inch sliding pin with a rounded end, which is normally supported in the left hand trunnion by means of a spring attached to the hand lever G. Between the two pinions lies a hardened steel pin or roller H, also 9-32 inch diameter, which has its bearings in aligned holes in the pinions, in which it is free to roll. This cross pin is located at a distance from the centre to suit the thickness of the stock used, and is retained endwise by the diameter of the trunnions. The pinions are made separate from the trunnions to make alignment of the cross pins easy. A short steel block projects in front of the pinions and carries two pins K, which act as guides or gauges for the blank hinge.



The principle of operation in the forming of the pin can be followed by study of the drawings, the enlarged sketch showing the start and finish positions of the forming roller. With the ram up, the position of the quadrant brings the forming pin H below the line of entrance of the stock, which passes under the central pin and over the pin H, the slot in the hinge blank being located over the pins K. The downward movement of the ram causes the quadrant to move the pinions and the forming pin H forms the stock about the centre pin F, the radius of the quadrant arms being such that the desired angle is traversed in the forming operation. This gives an eye that is only three-quarter circular, but for the purpose for which the hinge is used it is quite sufficient. The upward movement of the ram reverses the mechanism and there is enough spring in the stock to allow the pin F to be withdrawn freely.

## FORCED FITS AND SHRINK FITS

By W. S. STANDIFORD

IN machine construction and factory repairs, the method of holding wheels on shafts by means of a forced fit instead of the usual method of securing the parts to be held together by means of a key does not seem to be used to the extent that it should, considering the excellent results obtained with gear wheels, etc., that are subjected to heavy vibration. Pinions held on the ends of shafts by a key will not stand jarring for any length of time, as sooner or later they cause trouble by getting loose and coming off their shafts. In cases where the shaking and pressure exerted upon a pinion is continuous, the latter will remain fast upon its support for a much longer length of time than where the motion is intermittent and jerky as the heavy thrust and leverage soon forces out a key.

Two keys, put upon a quarter circle from each other, will enable a pinion to remain longer on a shaft; but the writer has found out by experience that where continuous running machinery is desired that gives the least amount of trouble to a factory's repair forces, it is much better to force a gear wheel on a shaft

DETAILS OF THE EYE-BENDING FIXTURE.

by hydraulic pressure, no key being needed in this case, as a pinion or gear wheel pressed on in this manner will remain until it requires to be removed by reason of worn teeth, removal being easily and quickly effected by cutting a slot in the bottom of a tooth and forcing a wedge in slot and knocking the wheel off with a hammer. In making press or forced fits, the part that is to be driven must, of course, be larger in diameter than the hole which receives it, but the difference in regard to such press fits is not so great as some machinists think should be the case, as all that is needed is to have the grip between the two metals sufficiently tight so as to prevent the parts from coming off. Any heavier pressure used for work of this character puts a strain upon the metal around the hole which will cause a cast iron pinion to break suddenly while it is in action. The usual practice among machinists in doing work of this kind is, to judge the proper amount of oversize allowance by the feel of calipers; but this is a very uncertain method as errors are likely to be made in judging sizes.

The correct method of taking such measurements is by means of inside micrometer calipers, used in the hole, and outside micrometer calipers to find the shaft size. This puts all measurements upon an exact basis, the worker knowing at all times just what allowance has been given in thousandths of an inch, instead of the slipshod caliper feel and its guesswork as to the proper amount of oversize required. A mechanic always gains by doing all work, whatever its character may be, as carefully as possible, as bad habits once formed are hard to break, and often lead to spoilt work. There is a limit to the sizes of articles made with forced or pressed fits, which is due to the fact that as the diameter of a shaft and hole in a pinion increases, more powerful hydraulic apparatus is required to press them together, so that a point is soon reached where it would not pay to keep an expensive and powerful machine around a shop for only occasional use.

### Simple Formulae

As a general rule, force fits are mostly made on such small objects as crank pins, car wheel axles, repair work and lathe and other machine construction parts that require to be held very securely. In judging the proper allowance for a press fit, several factors have to be taken into consideration, viz.: The thickness of metal surounding the hole, kind and quality of material of which the parts are made, the size of the work and also smoothness and accuracy of bore and shaft that are to be fitted together. However, as a general rule, to make a press fit of the greatest possible strength, there should be a difference in the sizes of the parts to be fitted of from two to three thousandths of an inch for each inch of diameter of the article. The following formula will serve to give an idea of the pressure in tons required for making forced fits for different sizes of shaft diameters. The required pressure in tons will be the fit allowances in thousandths of an inch multiplied by the diameter of shaft in inches and also by the factor of 1½.

As an example: Suppose that a gear wheel is to be forced on a 5-inch shaft, the press fit allowance being .002 for each inch of diameter. 5 x .002 = .010, the latter being the total allowance, and the pressure in tons will be 10 x 5 x 1½ = 75 tons. On smaller diameters of shafts where an extra heavy grip between the parts is desired, the larger figure of .003 can be used. Take the case of a 2-inch shaft, 2 x .003 = .006 the allowance, and the pressure in tons will be 6 x 2 x 1½ = 18 tons. It will be apparent from this that if the allowance figures given in both of the above examples were adhered to for large sizes of shafts that the necessary pressures would be very great and beyond the appliances found in most shops. To show this clearly, we will suppose that a 15-inch crank pin is to be fitted into its disk. Using an allowance of .002 inch x 15 inches = .030 the allowance, multiplying 30 x 15 x 1½ = 675 tons pressure needed to do the work. Very few large factories possess the facilities for obtaining such heavy pressures, which make extra tight fits that are unnecessary, as all that is required is sufficient pressures so as to make the parts hold together. In practice, for a shaft of 15 inches diameter, it will be found that .010 inch press allowance will be sufficient, the tonnage necessary to force them together being much less. Some mechanics taper the parts to be fitted together, thinking that tighter fits will result. This is bad practice, because the tendency of a taper fitted part to become loose under vibration is always present, and once it loosens, the entire fit frees itself, taking very little axial movement to do so. On the other hand, a taper fit does not abrade the surfaces of the parts pressed together to the extent that a level fit does. In order to prevent abrasion in work of this kind, it is advisable to lubricate the surfaces with white lead mixed with a little lard oil. It is best to keep the surfaces as smooth as possible so as to allow for renewing gears, etc., on the same shaft when they are needed.

Old wheels which have been pressed on and off shafts require a far greater pressure when being forced on another one. This is due to the fact that the metal has become surface-hardened by the pressure which it has already sustained, and on this account it takes double the pressure to force it on a shaft as contrasted with that of a new wheel of the same shaft diameter. Shrink fits are used in cases where the greatest possible binding effects are desired, they being used extensively by machinery manufacturers and also in railway locomotive shops for putting tyres on the driving wheels of engines, etc.

The allowance for a shrink fit depends to a great extent upon the thickness and amount of metal around the hole, as this has a great influence upon the stresses in the hub at the bore of a wheel and shaft that has been put on by shrinkage. The higher the heat of the outer member, the greater the shrinkage allowance, as the expansion is greater when a piece of steel is heated to 1,200 degrees Fah. than the same metal would have if it were only heated to 800 degrees. It is thus possible by this means to control the amount of adhesion between a wheel and a shaft put together by the shrinkage method; but in practice, there are limits beyond which it is not safe to go, on account of the mechanical stresses set up when the metal is cold. Should the shrinkage allowance exceed the elastic limit of the steel, either a permanent set will occur, with the metal around the hub of the wheel in a state of strain that is likely to develop into a crack by jarring at its weakest point, or the pressure on the hub may be so great that its ultimate strength is exceeded and it will burst after the shrunk parts are cold.

For the general run of machine work, an allowance of about .004 of an inch for each inch of internal diameter of a hole in a wheel will give satisfactory results. On account of their large diameters, railway locomotive tyres are shrunk on with an allowance of from 1/64 to 1/32 inch per foot of diameter.

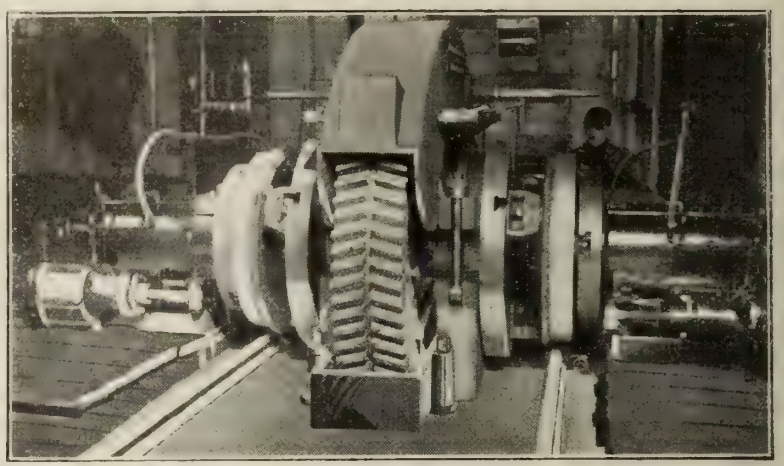
## TANK STEEL.

Tank steel has been defined by the Association of American Steel Manufacturers "as a grade to be used for ordinary fabrications or for structural purposes where no particular stresses are required. It should be free from "surface defects." The reason for making this definition lies in the fact that, since the outbreak of the war, a great deal of "tank steel" has been specified for purposes for which such steel was unsuited and then has had attached to it requirements that would throw the material into a higher classification without, of course, expecting to pay the extras required by such higher classification.

The ruling of the committee is, further, that if the buyers' specifications stipulate a tensile test from each plate as rolled, the material shall be classified as flange steel. Further, that if a flange steel purchase specifies a homogeneity test in addition to naming chemical and physical properties, the material becomes firebox steel. Again, that if the steel plate order carries specifications with regard to phosphorus and sulphur limits equivalent to the firebox grade, the steel shall be regarded as firebox steel unless the chemical tests are modified.

# DEVELOPMENTS IN SHOP EQUIPMENT

## CAR WHEEL LATHE



The John Bertram & Sons, Co., Ltd., Dundas, Ont., have recently installed in the C.P.R. shops, Toronto, Canada, a machine that is a new departure for this section of the country. This new machine tool is known as a No. 5 car wheel lathe of center driving type. As will be noted from the three photographs, it is of very rugged construction, and following are some of the features incorporated.

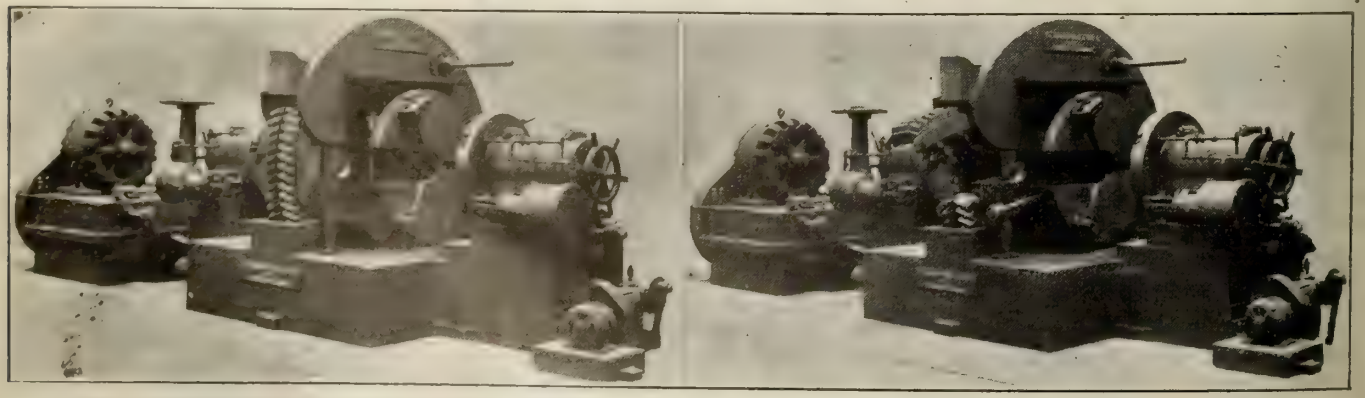
The tool will turn wheels from 26 inches to 42 inches in diameter on the tread. It accommodates the largest M.C.B. axles with outside journals up to 6½ inches diameter, and will take axles up to 9½ inches diameter with inside journals. The maximum distance between centers is 91½ inches; between tailstock faces 96 inches.

The large powerful drive in the center is of particular interest. The steel central driving gear and pinion are of the double herringbone type. Of course, for transmitting heavy torque, as required by this class of work, the herringbone style of gear is ideal, as its construction eliminates all end thrusts and is very smooth in operation, due to the spiral action of the teeth.

The central driving gear is mounted on a spool which revolves in large bearings in the bed. This spool has two faceplates that carry the drivers, and it has an opening of 10 inches to receive the axles. The driving gear is equipped with a patented hinged segment which operates automatically. It closes and locks as the wheels are rolled into the lathe, and unlocks and opens as they are rolled out. The operation of the segment requires no manipulation on the part of the workman.

The wheels are rolled into the lathe on short tracks as shown. A power operated elevating device quickly brings the work up to proper height for the split bushings to enter the tailstock sliding spindles. This elevating device is driven by a separate 5 H.P. constant speed motor.

THIS GIVES AN IDEA OF HOW MACHINE LOOKS WHEN IN ACTUAL USE.



### Tailstocks

The wheels are centered by tailstocks which are moved on, and clamped to the bed by powerful air cylinders. These tailstocks are under perfect control, air valves being within easy reach of the operator. For wheels with outside journals collapsible bushings are used that fit over the journals, and are tapered to fit the tailstock spindle. This method insures the tread of wheels being concentric with the journals. For wheels with inside journals, centers are used.

Each faceplate of the driving spool is equipped with three patented semi-automatic drivers, which engage the inside of the wheels near the circumference. These drivers are tightened by hand and exert a uniform pressure on the wheels. The tailstock faceplates are provided with independent chuck jaws which engage the outside of the wheels and support them against the thrust of the semi-automatic drivers already mentioned. This guarantees that the wheels are held with absolute rigidity, and chatter is eliminated; at the same time all torsional strains are relieved.

### Tool Rests

The tool rests are equipped with patented pneumatic clamps, these enabling the operator to change and clamp his tools in a few seconds without the aid of a wrench. The tools are clamped by means of a wedge action which forms a positive lock, independent of the air pressure. The tool slides have in and out adjustment for setting depths of cuts,

TWO VIEWS OF THE CAR WHEEL LATHE, ONE WITH DRIVING GEAR CLOSED, THE OTHER IN AN OPEN POSITION.

also hand longitudinal traverse. Slide wearing surfaces have hardened and ground steel plates to resist wear due to the excessive tool pressure. The tool slide screws are fitted up with ball thrust bearings, and the rests can be swivelled to provide for the taper of the wheel treads.

The power feed is obtained by direct gearing and is positive in action. The range is from ⅛ inch to ⅜ inch per revolution of the faceplates. There are 6.4 feeding strokes per revolution of the face plate, this giving practically a continuous feed.

The machine is equipped with a simple calipering device by means of which the operator can readily size both wheels to equal diameter. There are no exposed gears on the machines, these being suitably guarded, and all driving gears are made of steel. The driving spool is fitted with guards and wipers to prevent chips and dirt from getting into the bearings. Wipers are also attached to the tailstock to keep the tracks free from chips and dirt. The tool slides are also suitably guarded.

### The Drive

A 50 H.P. motor of 3 to 1 speed variation is used for direct current drives, while a 50 H.P. motor through gearing by which six faceplate speeds are obtained is used in the case of alternating current. Push button control is adopted, the panel being located at the most convenient position for the operator.

The regular equipment with this machine consists of calipering attachment, wheel elevating device, pneumatic tool clamps, set of three semi-automatic drivers for each faceplate, five sets of bushing for different size axles, tailstock traversed and clamped by air, push button control, and a set of eight tire turning tools.

Speaking to the operator of this machine, Canadian Machinery asked his views on the subject of vibration. "There is no such thing with this tool," was his answer, and watching it in actual operation we could not help but agree with him. Speaking on production, he claimed that ½ hour per set of wheels was a pretty fair average. In Fig. 1 is shown the machine with main drive gear closed, while Fig. 2 shows the gear open ready for entering the work. Fig. 3 depicts the machine in actual operation at the C.P.R. shops.

## AN INTERESTING PIPE-BENDING MACHINE.

The problem of bending wrought iron pipes to various degrees and getting the bend without distortion of the pipe has always been an interesting one. Many devices have been introduced to achieve the desired result, and we recently had the opportunity to see one of these at work. The machine in question is owned and operated by the Tube and Pipe Bending Co. of Ontario, St. Nicholas St., Toronto.

The device is made in two sizes, the smaller size being used for pipe up to 2-inch diameter, while the large machine can handle up to 6-inch extra heavy. The bending is, of course, carried out without any heating of the pipe.

The accompanying photograph will give a good idea of the machine and the principle on which it works. The drive from the belt pulley is transmitted by a worm to a worm wheel revolving in a horizontal plane underneath the table. On the table is mounted the form for bending, and these forms are, of course, made to accommodate the various sizes to be bent. The pipe to be bent is placed in the jaws of the vise and is run through between the form and vise the necessary distance to form the bend. The mandrel carried on the table is then run into the pipe just as far as is necessary. A series of stops on a quadrant under the table can be set to any number of degrees that may be required. When the pipe is set, the operator presses a pedal, which thows the head carrying the mandril into gear with the revolving worm, thus turning the head and mandril, and, of course, the pipe, through the arc previously settled. When the stop is reached, the machine disengages automatically. The mandril, owing to the path described by the table, automatically draws out of the pipe as the bend is formed.

The machine can be used to put several bends in a pipe, and we saw a number of exhaust pipes for automobiles which contained no less than five bends. One great feature with a machine of this kind is that, once it is set, it can produce any number of absolutely identical bends. This makes it especially useful where large numbers of pipes must be bent to a uniform standard. We had an opportunity to examine some four-inch pipe which had been bent to about 60 degrees, and there was no sign of any wrinkles or distortion on the inner side of the bend. A large number of bends on extra heavy pipe for marine work were performed on the large machine during the shipbuilding activities recently, and were all passed by Lloyd's surveyors.

We understand this machine is fully protected by patents in Canada and the U. S.

## SHEET STEEL PULLEY

A new design of sheet steel pulley has been placed on the market by the Worcester Pressed Steel Co., of Worcester, Mass. The pulley is so constructed that it presents a smooth surface on each side, being free from spokes and hubs, thus almost eliminating the possibility of danger to the workmen, and the creation of air draft. It is light and strong and is said to be easily removed or placed in position. These pulleys are made in sizes ranging from 6 to 18 inches in diameter and with any width of face.

## SIZE BLOCK FOR SETTING TOOLS

An adjustable tool for the setting of machine tools is now being offered to the trade by M. B. Hill, of Worcester, Mass. The top gauging block has three steps and moves upon an inclined surface on the base. Through a T-slot in the base a bolt extends up into the body of the top block, the upper end of this bolt having a tapered hole into which the end of a screw, passing through the block, enters. This screw is provided with a knurled head, a slight turn of which is sufficient to clamp the block in any desired position.

## ADJUSTABLE COPING SAW

The Consolidated Tool Works are now making a coping saw in which the blade can easily be adjusted to any desired position and quickly locked. The means of setting are so located that adjustments can be made without altering the position of the hands when using the tool. The frame is nickel plated and polished, and the handle is made of wood and black enamelled.

BENDING AUTOMOBILE EXHAUST PIPES.

## Let the Steel Corporation Act

THE steel market in this country and the steel market in the United States is about as ragged as anything could be imagined.

For the ultimate consumer, a ton of steel is a ton of steel, and yet there seems to be no end of variations to the price at which he may purchase.

The United States Steel Corporation is supposed to be selling at a fixed schedule, based on the list in operation under government control on March 21, 1919. Yet the market hears plenty of stories of the Corporation meeting prices that are named by some of the independents in order to hold its business.

This paper is not charging that this practice is being followed in many cases, but the incident is used here to show that there is no confidence even in the present schedule of the United States Steel Corporation, and as far as the independents are concerned, there have been so many prices peddled in Canada that it is quite within the range of absolute truth to state that there is no recognized steel market price at the moment.

Under such a condition, the steel mills and the steel warehouses, and any branch of industry into which steel enters largely as a basic material, knows full well that buying is going to be carried on on an ounce for ounce basis. Absolute needs are attended to, but beyond that the buyers are not going, nor will they go.

The independents have made a move to strengthen the situation now by withdrawing, or threatening to withdraw, certain prices they have named in this district. They cannot strengthen the market in this way. They have done much to muss the market up, but it is hard to see where their hand comes in in the "clearing-the-air" process.

The United States Steel Corporation can do it, and they should do it. Canadian Machinery does not urge that the announcement of a new schedule by the United States Steel Corporation would result in an increase in the tonnage sent to the mills under present conditions, but it would set a standard, and fix something around which the market could build for the future. Right now there is nothing to which the steel world can look with any degree of stability. Even the much-talked-of schedule of the Steel Corporation is not regarded in Canada as the absolute selling price of that organization.

It seems likely that the Steel Corporation will move shortly, and the steel market, and the machine tool industry to a very large extent, awaits the announcement. The Corporation can give that much needed stability to the market by announcing its new schedule. It can be done by no other agency, and it does appear as though the time were fully ripe for the Corporation to act.

---

ONCE more the Montreal scrap metal dealers have risen and whacked down the prices which they might possibly pay in case they might possibly buy something that they might possibly sell to some concern that might possibly have some use for it.

But the coming of spring, or the opening of navigation, or the injection of new courage of some sort or other, has caused the Montreal dealers to apply the honorable arts of subtraction and division on the scrap list. And when said list was handed its hat and coat and told to go out and walk around, its friends of former days knew it not.

For are they not offering $6 per hundred pounds for copper which in war days was scarce at $20? Likewise boiler plate is wearing a $10 suit instead of a $27 outfit in war days. And heavy melting steel is clad in a $9 design against the haughty $24 of 1918.

## Some Good Issues Coming

Following out its policy of keeping readers well informed of coming events in its editorial pages, Canadian Machinery presents the following for the coming weeks:

In the April 21st issue there will be an article on "Broaching." This will embody various examples of work performed, together with production data. This practice, one of the more recent developments to be followed in this country, has come into the realm of milling, drilling, slotting and keyseating operations.

April 28th will find the leading article dealing with methods of efficient threading. Here again the interest will be very general in this article. Various examples, well illustrated, will be shown under actual production work.

On May 5th, "Surface Grinding" will be the leading article, and it may be there will be something on your problem.

"Roller Bearings In Industry" will be featured in May 12th, and a number of actual applications are to be shown.

In addition to the above we have other good articles on various phases of machine shop practice which will appear throughout these four issues. These are all practical machine shop articles. You can hardly afford to miss them.

# The Problem of the Railroads

HAS over-organization on the part of railroad workers forced a system on the railroads that is too hard and too complex for them to finance successfully?

The Boston News Bureau brings out the following, which has received wide circulation on both sides of the border:

"When a railway engine goes to the shop for repairs these days, men of three, four, even of five crafts, have to be used to do what the men of two crafts, and even of one craft, did four years ago. When a locomotive headlight generator has to be removed nowadays, six men have to be employed to do what, after all, is a simple job—an electrician with his helper, a sheet-metal worker with his helper, and a machinist with his helper. Four years ago, two men, a machinist and his assistant, did the whole job.

"When a railway engine boiler springs a leak three craftsmen, each with a helper—under the rules that now regulate railway labor—have to be employed to make the necessary repairs.

"A sheet-metal worker, with a helper standing by to hand him his tools, will loosen the jacket; a locomotive carpenter, with another assistant standing at his elbow to handle his tools and pass them to the skilled workman, will remove the lagging; then a boilermaker, with a third helper at hand to wait upon him, will caulk the leak; the carpenter and his helper will replace the lagging, and the sheet-metal worker and his assistant will then tighten the jacket. Six men, three skilled and three semi-skilled, have waited their turns and stood round in each other's way, whereas a good boilermaker and his helper could have done the job as well and quicker. If a boiler check has to be changed, two men have to do now what one man used to do.

THE GREAT EYE REMEDY.

### The Conditions Four Years Ago

"Four years ago, an ordinary handy shopman could change a nozzle tip in the front end of a locomotive; he could do it to-day if the rules would permit it. But the rules require that six men shall be employed to do that small task—a boilermaker and his assistant, a pipeman and his assistant, and a machinist and his assistant.

"These are all railroad shopcraft jobs. All the workmen are highly paid. All belong to the skilled labor classifications. For each illustration here given, a hundred more might be cited, all calculated to show just what the railroads of the United States are up against."

---

Advices from Germany state that firms are again putting on the "Made in Germany" mark. German industry is gaining strength every day, and that strength is being aided and helped by just such industrial crises as are being forced in England now.

* * *

Some men succeed because they don't know when they're licked.

* * *

According to reports reaching this office, the scrap metal market in Scotland is shot to pieces. But the scrap situation in Ireland remains active.

* * *

One dealer handled twice as many orders in March as February, but total sales showed an increase of only 15 per cent. Yes, but think of the impetus that sort of buying is giving to manufacturers of wrapping paper, twine and shoe leather.

* * *

A Toronto machine tool dealer submits this one: "At one point on the way down town I saw a number of pickets trying to keep men from going to work. Down at the Government employment office there was another group out looking for work. Now, how far are we going to get on that basis?"

* * *

# This Canada of Ours

New York *Sun*: Canada to-day is unique among the great nations in that she has no serious labor troubles, and in that she appears to be effecting the difficult process of readjustment to after-the-war conditions as painlessly as may be. Montreal reports that in most cases where wage reductions have been necessary they have been made without friction, and that this holds true of the Pacific coast and the Middle West, as well as of the more industrial Ontario.

The attitude of the Dominion and Provincial Government toward business has been helpful, but, fundamentally, such successful readjustment must be due to the exercise of plain common sense on the part of both labor and capital. It is not the first time that Canada has set an example worth studying.

One thinks of Canada as primarily an agricultural nation, and it is still true that her wheat and other grains outrun any other commodity. But the Dominion has turned more and more to manufacture, and its industries grow at a tremendous pace. Doubtless the growth may continue as further water power is put to use, and more resources in coal and minerals are opened up and her network of railroads extended.

# MARKET DEVELOPMENTS

# Stability Needed In The Steel Market

## Several Promising Inquiries in the Markets—Some Word is Expected Soon From the U.S. Steel Corporation—More Orders Being Taken in Order to Get the Same Turnover as Formerly

THERE is a growing feeling in the steel market that it is high time for the United States Steel Corporation to make some announcement regarding its schedule. This has been in effect since March 21, 1919, and conditions have changed very materially since then. Then the market has in it many stories tending to show that this schedule of the Steel Corporation is being shaded to meet competition. The Steel Corporation is the one agency that can lend any degree of stability to the market. Its announcement, were it to contain reductions, might not start any buying at all, but it would serve the very good purpose of setting some standards around which the markets of the future weeks and months might be built. At present, any such standard is entirely lacking, and the market is ragged as a result.

During the week several independent steel mills have withdrawn low prices they have been quoting to Canadians, and this has lent a little strength to the situation. Buying in the steel and iron world is still carried on on a very confined basis. Actual wants are attended to, but not a pound over in most cases. Conditions are not favorable to heavy buying.

The machine tool market continues to receive a number of inquiries, and many of them will undoubtedly be turned into business. In this field the machine tool houses have a new problem to deal with, in that they find it necessary to watch closely the credit of some of their former customers. Collections are reported as being more or less spotty.

Small tools are being sold sparingly. One dealer reported that during the last month he had made twice the number of sales, compared with February, yet the actual increase in his turnover had been only fifteen per cent.

The scrap metal market continues as it has been for months now, at about as low an ebb as possible. The volume of business moving is very small, and there is nothing in sight to indicate that an improvement is imminent.

## MONTREAL DEALERS ONCE MORE PUT THE AXE INTO LOWLY SCRAP PRICES

Special to CANADIAN MACHINERY.

MONTREAL, April 14.—Those in the trade who, in the closing days of the old year, anticipated a spring revival of normal activity, now look for business revival still farther ahead. Nothing has developed that gives pronounced encouragement to an early revival of active industry, although some reports seem to foreshadow a gradual betterment. In speaking of trade one dealer here remarked that "the year to date has shown steady improvement. January was quiet, February was more so, March showed a gradual increase from week to week, and if April continues to show returns like the first week, we will have the best month in nearly a year; not the turnover we had a year ago, but a substantial increase over any of the previous six months." In commenting on the recent reaction of the U. S. steel market and the advance in prices on certain classes of steel, one merchant stated: "It is difficult to see how any other action could have been taken. There is little doubt that many mills, particularly the smaller of the independents, had to operate on a very close margin of profits, if not at a slight loss. It is quite evident that, with all the cutting of the past six months, the volume of business placed has not shown any marked increase. A comparison might be given in the quotation on sheet bar billets, which at the moment is $47 per ton ($2.35 per hundred). Added to this would be the cost of re-rolling operations, and yet we have known instances where bars have been sold at $2 and $2.25. How is it done?"

Few dealers will commit themselves on the early possibilities as experience has amply demonstrated the fallacy of industrial prediction. "It may mean a long period of dullness," said a dealer, "similar to that of the past six months, while on the other hand, the revival may take place overnight. We know for a certainty that few consumers are heavily stocked and the majority are buying only what they need for immediate use, and succeed in securing the lowest possibl price for the least possible quantity. Little buying is being done by the rail roads and this is a puzzle to many of th dealers. Owing to the competition amon American steel mills, the Pittsburg quo tations on some lines have been given range of from $2.25 to $2.65 on tan plates, and from $2.25 to $2.45 on struc tural shapes. Local quotations on plate have declined $5 per ton, the price bein $5 per hundred on the 3-16 inch size, an $4.50 on the heavier plates. The move ment on sheets is light but steady; quo tations are easier. Black, 28, are now cents, and blue annealed 5¼ cents pe pound. Canada plates, dull, are consid erably lower at $7.50 per hundred. Quo tations on all bright have been with drawn. Premier No. 28 are quoted a 8¼ cents, a decline of ½ cent per poun

### Dealers Depleting Stocks

A feature of the present machine too and supply business is the wide distribu tion of small orders, a factor that aggre gates a fair volume of business but whic likewise adds considerably to the expens necessary in securing it. The conserva tive buying policy of many manufactu ing plants has necessitated increase

calls on the part of dealers and salesmen, and very often the small margin of profit is wiped out by the resultant overhead and selling costs. If any one line might be termed active the statement would probably apply to construction machinery, as dealers in contractors' supplies are reporting a fair business. The conservatism of the average consumer is ably seconded by many dealers in their method of clearing out surplus stocks and acquiring only those lines that have a quick sale. The market today does not require that orders for tools or supplies must be on the books far in advance, so that the dealers can relay the customer's requirements on to the manufacturer and obtain prompt delivery.

### Sharp Declines in Scrap

While there is no pronounced change in the old material situation, the market is featured by another general decline in price quotations. The consumers are not falling over themselves in placing orders, even when a sharp reduction is announced. Prices are only taken into consideration when an actual covering is required, and the sale is transacted on its individual merits, the purchaser usually getting the best of the argument. The volume of business is exceedingly light, with few large sales recorded. Dealers would be willing to adopt any reasonable method of infusing their customers with a spirit of buying, but price cutting does not appear to serve the purpose. Price reductions this week range from $1 to $8 per ton, the heaviest decline being registered against malleable scrap, which has fallen to $12 per ton. Heavy melting steel is now quoted at $9, a decline of $3 on the previous price. Stove plate at $20 is $3 off, and cast borings have declined from $5 to $3 per ton. Other lines show a proportionate reduction. Non-ferrous lines are likewise weaker but business shows no improvement. Coppers and brasses are down, light copper being quoted at the low figure of 6 cents per pound. Heavy lead has again weakened, the present price being 3½ cents per pound.

## POINTS IN WEEK'S MARKETING NOTES

**A report received from Glasgow states that very low prices are being offered for scrap iron and steel, the values all being below those prevalent before the war.**

**The Republic Iron and Steel Co. announce an advance of $2 per ton in bars, shapes, and plates.**

**Pittsburgh refers this week to "the market dragging along much as in the last few weeks." The feeling seems to be that when the Corporation announces the new schedule it will show substantial reductions.**

**Canadian buyers of black sheets have been advised of the withdrawal of prices quoted to them by several of the independent mills.**

**A report from London states that under existing rates of exchange German goods can be sold at a price less than the cost of materials in the United Kingdom.**

**Machine tool dealers in this district have a large number of inquiries in their offices just now, but actual orders are still slow. One Canadian manufacturer of machine tools says that at the present time they have tenders out on $750,000 worth of equipment.**

## GOOD BUSINESS IN CERTAIN LINES

### Toronto Dealers and Warehouse Interests Have Varied Experience in Week's Trading

TORONTO.—There are lines of business where improvements have been noticed, and there are others where the claim is made that one week is very much the same as another in the present market.

The machine tool trade is still quiet as regards actual placing of business, and it is still a fact that the majority of the trade is going to firms that handle both new and used equipment. Some dealers are carrying very little new stock now — some of them almost none at all—while the used equipment is in stock and can be inspected at any time. One or two dealers have prospects away to points in the United States for the purpose of inspecting machine tools there that cannot be seen in Canada because there are none operating here. When prospects get interested enough to go out inspecting machines at that distance, sales are not far off.

Several dealers reported that inquiries are improving, and judging from the list of proposals they have out, they should have some business on their books before long if they land only a small portion of their prospects. There is a certain element of uncertainty in the market on the matter of prices, and several dealers stated this week that they were not satisfied that they had reached the bottom of the market, and also that many of their customers seemed to entertain the same views.

### Reports Good Month

The manager of one of the Toronto houses reported that they had done a good business in the last month. "Of course," he added, "when we say that we do not mean that it is good compared with some of the months during the last few years, but when present conditions are considered the month's business was good."

This same firm also brought out the point that there was something else to do besides chasing orders, and that was the watching of credits. Some firms that were considered very good a year or so ago are pretty well tied up for working capital now, and banks are not at all anxious to deal in their paper, so it is a fact that a certain amount of business has not come into the machine tool field for that reason.

The sale of small tools is going on in a small way. Actual wants are being supplied, but that is about all that is being done, and several firms that have restarted operations after a shutdown of several months are not buying because they were well stocked at the time of the stopping of operations.

The policy seems to be followed out in many lines, and although it does not bring much grist to the mill for the present, it is certainly clearing the shelves bare for business that must come in when operations become more marked.

### Steel Prices Stiffen?

The weight of evidence in the steel market this week seems to show that prices have not sagged any more, but in certain directions they have become stronger. It is known that one large importer—a manufacturer in this case—who takes quite a tonnage of sheets, was informed by several of the mills that a low figure on black sheets was being withdrawn at once. He had been buying around 4c base Pittsburgh district, and even at that figure had not bought very heavily. Another representative of several independent sheet mills has also informed his trade here that prices on which he is now working are likely to be withdrawn without notice. The trade here is wondering what it all means. Some of the warehouse interests seem inclined to think it is a move to hurry up any business that may be undecided as to disposition, while others incline to the belief that cost sheets may show that sheets cannot be turned out at the figure at which they are being offered to-day. Still another Toronto buyer had word during the week from a mill in the Ohio valley that sheets were selling below actual cost of production, and the price was being withdrawn. There is still a fair sale for sheets in this district. In fact it is one of the lines that has remained fairly good right along.

Bars are quiet yet. We are still quoting 4.25 as the average price but better figures are being made on certain deals. The tonnage may be desirable enough to warrant a closer price, or the warehouse may be overstocked and anxious to move material. In such cases a price better than 4.25 can be secured.

Tubes are quieter than they have been for some time. The trade, judging from

former years, should look for a pretty fair trade in this line at present, but so far it has not developed, and just now the average is not as good as during the first two months of the year.

### Buying in Small Lots

"We are selling in smaller lots to-day than we have for years." That remark is heard in several lines. It is known that there are orders going through and being filled for very small quantities of sheets and bars and tubes, while the same thing is true of small tools. One steel merchant claimed, "We are sending out any number of bills for three and four dollars, a thing unheard of before. It is also more expensive to ship in this way, especially where we have to make deliveries in the city." Another dealer, this time in small tools, gives his experiences as follows: "During the last month we shipped out twice as many orders as during February, but when it was all totalled up we found out that our increase in actual business had been only 15 per cent."

# THE STEEL MARKET IS RAGGED AND STABILITY IS NEEDED MORE THAN EVER

Special to CANADIAN MACHINERY.

PITTSBURGH, April 14.—An interesting incident is the announcement of the Republic Iron & Steel Co. of an advance of $2 a ton in its prices for bars, shapes and plates, the advanced prices being 2.10c for bars and 2.20c for shapes and plates. The company made no change in its prices on tubular goods or sheets. It is inferred in the trade that the Republic Company took this action as an experiment, in hope that other independents would do likewise, and that the Steel Corporation would reduce its prices to this basis. The balance of probability is that the other independents will not follow. The theory is a good one, for it is certain the Steel Corporation will reduce its prices at some time, and when it does it will, of course, go at least as far as the lowest prices made by independents. While Republic's regular prices were 2c on bars and 2.10c on shapes and plates there have been some sales at several dollars a ton less, when a fair sized tonnage was involved, with attractive specifications. Republic's advance does not cost anything, since very little business was being booked at the old prices, and a reduction can be made at any time, or competitive prices can be met without any formal reduction being made.

On the same day that the Republic Company announced the advance in its prices on bars, shapes and plates, the Steel & Tube Co. of America, formerly the Mark Manufacturing Co., announced an entirely new schedule of prices on tubular goods, at $10 a ton below the Industrial Board or Steel Corporation prices. The action was entirely unexpected and has caused considerable comment. In line pipe a reduction of $10 from the nominal prices means nothing since line pipe sold weeks ago at a greater concession, and the reduction does not mean a great deal as to oil country goods generally, but in standard steel pipe it is very important, for the shading in this line has been only $2 to $4 a ton. The company's basing discount on standard steel pipe is now 62½ per cent., against the regular published discount of 57½ per cent. shown in the discount lists of other mills. What action the other makers will take remains to be seen, nothing having been done thus far. The market as a whole cannot be quoted at the reduced price of this one interest, not because one good-sized producer could not supply all the current inquiry, but because it is a Western concern and while quoting on the basis of Pittsburgh plus freight to destination it would not sell in the East since then it would have to absorb freight.

Steel prices in general show no change, the market dragging along in this respect much as in the past few weeks. On most products the independents have made a sort of market, though by no means a clearly defined one, at prices ranging from $7 a ton on bars to $18 on galvanized sheets below the Industrial Board or Steel Corporation prices. The Steel Corporation has taken no action. The trade is still speculating as to when the Corporation will make a move as to prices and wages. There is no buying pressure, however, and no evidence that if the Corporation should reduce its prices a buying movement would start. There is no question, however, but that eventually the Corporation must reduce, for otherwise buyers will have no confidence in the market and would not buy if they were otherwise disposed to do so. When the Corporation does reduce prices the reduction will probably be quite extensive.

In some quarters it is being remarked that the Corporation ought to reduce prices, so as to start a buying movement, and it is remarked that in the past a buying movement generally followed sharp reductions in steel prices. Buying could not thus be forced, however. These observers confuse cause and effect. In the past, when the steel producers reduced prices they did not do so arbitrarily, but waited until they could see that there was latent demand, so that the demand, though latent, was really the cause of the reduction. Just now there is no such demand. The mills would be keen enough to see the demand if it existed. The average consumer is more interested in seeing prices maintained so that he can dispose of his stocks than in seeing prices reduced against purchases still to be made.

### Steel Corporation Tonnage

The United States Steel Corporation's unfilled obligations amounted to 6,284,765 tons at the end of March, showing a decrease during March of 649,102 tons, an amount equal to 46 per cent. of capacity for the month. Shipments were at about 51 per cent. and the difference between these, only 5 per cent., represents the net bookings, or the total bookings minus any cancellations that may have occurred. It is improbable there were any cancellations of importance, so that evidently the Corporation booked scarcely any new business in March. References are frequently made to the rate at which the Steel Corporation is receiving business, but that is another matter, the reference being to shipping orders, in many cases merely "releases" against orders previously suspended, and thus not new business in the sense of being reportable as additional unfilled obligations. The Corporation's operations now are on old business and on specifications now being received against old contracts, chiefly the former.

### Steel Production

Production of steel ingots by the Steel Corporation in March is understood to have been at about 51 per cent. of capacity. From this, and the report compiled by the American Iron and Steel Institute showing the monthly production of 30 of the steel producing companies, it can be computed that the independents during March produced at 31 per cent. of their capacity, and this, with the Corporation operation, makes an average for the industry as a whole of about 40 per cent. Evidences have been coming out of late that the trade reports have tended to underestimate the rate at which the independent steel companies are operating. It is very difficult to make accurate estimates because plants and departments are starting and stopping all the time. Perhaps the personal element enters, by each independent objecting to its full production being known, for fear its competitors would think it is cutting prices more than is the case. It should be noted that the monthly ingot report is not a precise guide to the total production because some steel interests do not report, and they may be operating at much higher or lower rates than are those that do report.

The West Leechburg Steel Co. has formally announced a price of 2.75c on hot rolled strip steel. The market has been difficult to quote of late, there being so few sales to define prices. Cold rolled strip can be done at about 5.70c, the nominal price being 6c.

## NEW YORK TOOL TRADE VERY QUIET

**No Improvement Noticed and Prospects Not Being Turned Into Business**

Special to CANADIAN MACHINERY.

NEW YORK, April 14.—Despite a promising number of "live" prospects—or at least inquiries that were thought to be "live"—the machine tool markets of the East are quieter than at any time this year, and that is saying a great deal. Very few orders are being placed, and such as there are come mostly from small manufacturers and are for single tools. The larger users of machine tool equipment are doing virtually nothing.

In some departments of industry there are signs of an improvement, particularly in the automobile, textile and shoe trades, but this betterment has not yet created any better demand for machine tools. In fact, most of the automobile companies apparently have about all of the equipment they will need for this year's production, and in some instances have more than they will need. Either they will become sellers of some of their surplus equipment or they will manufacture in their own plants automobile parts which heretofore have been supplied to them by other companies.

No doubt the present unsettlement in all metal working lines is due in considerable measure to the fact that the Steel Corporation has not yet announced its price policy. The fact that buyers are expecting a sharp reduction by the Steel Corporation has unsettled the steel market and it naturally follows that products made from iron and steel feel the same unsettlement.

Moreover, there can be no very active machine tool buying movement until general business has revived sufficiently to require the work that machine tools do. Yet if the inquiries which have come to the attention of machine tool builders and their representatives since the first of the year were all to be closed within, say, the next thirty days, there would be a fairly good volume of business.

## MUST WATCH THE CREDITS CLOSELY

**Some Firms Having Trouble with Collections That Used to Come as a Matter of Course**

"It is not simply a matter of selling now, but also watching the changing credits of various firms." According to the head of one Toronto firm of machine tool dealers this is the dual occupation of many of the fraternity just now. "I know of several cases where a very nice order can be secured at any time, but the trouble is with the financing of the deal. The buyer wants more in the way of terms than we are prepared to offer, nor does there seem to be much hope of getting assistance from the bank."

"There is also a wide variance in the collections. Some firms are paying just as promptly as they ever did, while in other cases they are looking for all sorts of excuses, and finding them, too. One of the oddest things we have come across happened when a firm refused to pay a bill long overdue; they claimed a machine previously put in would not do a certain operation. We looked through all the correspondence and found that this operation had never been mentioned. That machine had been paid for long ago and had nothing to do with the order under consideration. However, I made an offer of allowing a certain amount on the machine already in, and they promised to have a cheque down here by a certain day and hour. Well, we never got it What can you do in a case like that? We want to make conditions just as easy as possible, and yet we want our money. The firm a year ago was in splendid shape, and all right yet. We don't want to force matters, so there it rests. And in the meantime we have not got our money."

## URGES DEALERS NOT TO ALLOW STOCKS TO GET DOWN TOO LOW

One of the twist drill firms, in a little book recently issued, urges dealers not to allow stocks to run too low. It says in part:

Under the present trying business conditions, it is perhaps human nature to reduce stock inventories. But this retrenchment may be carried too far. We see examples of it every day.

In every line of business there are certain staple lines which are called for at all times. And these articles must be kept in stock or the business of the dealer must suffer.

This is especially true in the tool business.

There are certain lists and sizes that are in constant demand even when business is dull. If a dealer does not maintain adequate stocks, his trade is bound to fall off.

Look at it from the other fellow's point of view.

Perhaps he sends a messenger to you for a few common sizes of drills or reamers. The order is not large but the consumer must have these few tools immediately. You say, "I'm sorry but we are just out of this or that and I cannot fill your order right away. Just wait a little while though, and I'll send out and get it."

As a result the consumer's messenger must wait until you have sent out and gathered up the order. This waste of time in dollars and cents may be more than the actual value of the few drills.

Or to make the case even worse, the consumer may send his truck and driver to pick up this small order. Figure out for yourself the cost of keeping a big truck and its driver waiting for an hour or two while you go and obtain the few simple tools desired.

And what is the usual result?

As a rule the messenger or truck driver cannot wait. His time is valuable and although you may be able to supply some of the tools, he will not split the order. He goes to a dealer that can fill the order complete. This may be one of your greatest competitors who has shown foresight enough to keep a fair supply of the commonly called for tools on hand. As a result you lose the sale of the tools you had on hand and, what is more, the consumer having found out where he can get his orders filled goes there the next time he wants prompt service and he figures that your profit is legitimate only when you give him what he wants when he wants it.

## TOOK BACK THE LOW SHEET PRICE

**Hamilton Manufacturer Believes That Low Price in Black Sheets Has About Been Touched**

Hamilton.—That the bottom of the black sheet market is here, or not far distant, is the opinion of A. T. Enlow, president and general manager of the Dominion Sheet Metal Corporation.

Mr. Enlow had offers from several independent mills, quoting an attractive price on black sheets, of which he buys large quantities for putting through his galvanizing plant. A few days ago he received advice that the price was to be withdrawn, or that it had been withdrawn by some of the mills.

Fortunately, Mr. Enlow was able to cover his requirements when buying was at its best from his point of view.

Some of the prices that were being quoted on black sheets in the last few weeks undoubtedly represented figures that were below the actual cost of production.

**Make Screw Cutting Tools.**—Galt has a new industry in Hi-Speed Tools, Ltd., organized to manufacture screw cutting tools, taps, dies, gauges, standard and special punching, stamping and forming dies. They plan to be in full operation by May 1. The directors are: W. W. Champ, Regina, Sask., president; L. W. O'Connor, Galt, secretary and manager, and J. A. Johnston, Galt., vice-president. Harry Champ is factory manager. The company starts with a staff that has had much experience in this department of tool production. Machinery is now being installed in their temporary factory in a wing of the Perfect Machine building.

## NEW SHOPS, TENDERS AND CONTRACTS PERSONAL AND TRADE NOTES

## MUCH DEPENDS ON FARM CROPS

**Brantford Manufacturer Has Contract for Turning Out a Small Farm Engine**

A. A. Goodwin, president of the Ker & Goodwin Machinery Co., Ltd., of Brantford, when asked for his opinion on the business outlook, informed Canadian Machinery that as far as his business is concerned the prospects for a big increase depend entirely on the crop outcome in the West.

He is a keen student of market conditions and says that all indications point to this year's harvest being the greatest that Canada has ever produced.

Mr. Goodwin says that 33 1-3 per cent. more land will be under cultivation this year over last, and this, together with the snowfalls that are now being experienced in the wheat belt, point to a banner year for Canada's great West. Mr. Goodwin further informed Canadian Machinery that while general machine work is inclined to be slack they have just signed contracts with the Renfrew Machinery Co. and A. R. Williams, of Toronto, for the sale of a large number of the Hvid type, Brantford oil engines that they are manufacturing. These are unique little engines, especially adaptable for farm use, and are constructed along Diesel lines, having no spark plugs, coils, magnetos, batteries, wires, switches or carburetors, and using crude oil or kerosene for fuel.

## MANY TENDERS BUT FEW ORDERS

**How Some of the Galt Firms Are Doing in These Days of Reconstruction**

GALT.—Mr. Goldie, of the Goldie, McCulloch Co. of this city, when interviewed on the subject of market conditions said present business is decidedly slack. His company has $750,000 worth of tenders out at the present time but has small hopes of this resulting in orders until such time as a reduction of wages, coupled with a showing of more energy on the part of the workers, and a steady market would offer more inducement for building operations.

Just when these conditions would come about Mr. Goldie could not say, but felt that the coming summer would bring forth a change for the better. The need of immediate construction work is great and it only remains for a restoration of public confidence through the adjustment of the wage question and the settling of the market to see work commenced on a large scale.

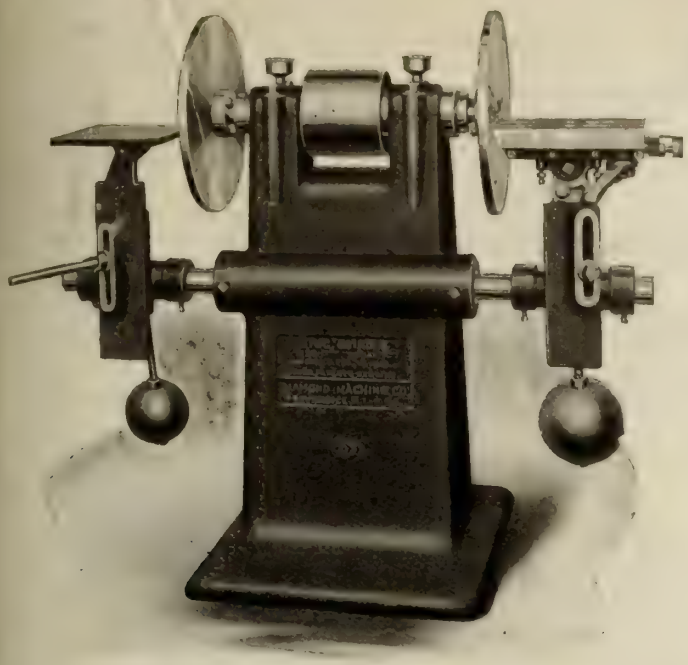
### A Busy Shop Here

W. D. Sheldon, of Sheldons, Ltd., said his plant has not lost an hour as yet. Orders are continuing to come in and if present conditions hold Mr. Sheldon says that this will be one of the best years of business his firm has ever enjoyed.

### Hinges on Steel Corporation

Mr. Cowan, president of Cowan & Co., manufacturers of woodworking machinery, told this paper he felt that the results of the annual meeting of the United States Steel Corporation at the end of the present month would affect conditions to a great extent. If, as expected, steel prices take a drop, Mr. Cowan thinks that construction work will begin to move, especially so if the worker can be made to realize that he must speed up his productive powers.

### His Unlucky Day



April 5 proved to be an unlucky day for John Turnbull, a shareholder and superintendent of the Shirley, Deitrich Co., Ltd., of Galt.

Mr. Turnbull was doing some experimental work on a thin bevel edge emery wheel when the little finger on his left hand got caught in some manner between the wheel and the rest, causing him to lose his finger close to the hand. For a man well on to sixty years of age Mr. Turnbull showed remarkable fortitude. He took the rest of the day off but when the writer called the day after the accident Mr. Turnbull was back on the job, superintending operations with his hand and arm in a sling.

DESTROYING THE SEED OF PROGRESS.

# DIAMOND
## DISC GRINDERS

Good grinding in fast time has made the Diamond popular in a host of shops. The right design and build eliminate vibration and give the operator a perfect surface every time. There is a suitable size and equipment for every surface grinding job you have. Workmanship and material of "Diamond" quality throughout.

May we send you catalogue?

**The A. R. Williams Machinery Company, Limited**

ST. JOHN, N.B.
WINNIPEG, VANCOUVER

*If It's Machinery, Write "Williams"*

64 Front Street West
TORONTO

## Pig Iron Market

The March pig iron statistics show the greatest shrinkage in output in all the months of the decline, and the production during the last week has been the smallest on record in proportion to the country's capacity.

An inquiry has been put out on the Pittsburgh market by the Oil Well Supply Co., for 1,000 to 2,000 tons of foundry iron for delivery between now and July 1st, and the American Radiator Company is asking prices on a total of 7,600 tons of foundry iron for early delivery at its several plants. Neither inquiry has been closed and there is some doubt whether all of the iron asked for will be placed in the near future.

The average prices for basic and Bessemer iron from Valley furnaces in March, as compiled by W. P. Snyder & Co., were $24.50 for basic and $26.50 for Bessemer, as compared with $25 and $27 respectively in February.

While buying is still much below normal at Chicago, there are indications of improvement. Some of the foundries serving the automobile industry are again getting busy.

Cincinnati reports the dullest week for the past year, even carload orders being very few.

One iron maker on the Birmingham market reports a large number of small orders, but no large ones, during the past week. He also shipped as much iron as one furnace made. The $25 base seems to have stood pretty well, being shaded only in case of close competition.

The Buffalo market has improved slightly during the last week. One interest has started another blast furnace and another intends to start an open hearth within a few days.

One company reports inquiry for 4,000 tons of pig iron.

## Scrap Metal Market

The decline in prices on scrap material is still unchecked. Melters almost without exception in the Pittsburgh district are out of the market, and dealers who have yards appear to have all the funds they care to have tied up employed in the tonnages now lying in their yards.

The market at Chicago received a slight stimulus during the past week as a result of the cleaning up of old contracts for heavy melting and malleable which expired with the end of the month.

The small amount of business transacted at New York in scrap material indicates that prices are still descending.

Cleveland reports practically no change in the scrap market. A local mill has purchased a few small lots of heavy melting steel at $12 to lay down in its yard, and turnings are being purchased by dealers in small lots for yard stocks at $6 and $7.

The scrap market continues to be dull at St. Louis, but dealers are beginning to pick up some scrap to lay down in their yards.

Owing to the prices of all grades of scrap dropping so low at Philadelphia only forced sales are being made.

---

**Want Equipment.**—The Crown Furniture Co., Ltd., of Preston, Ont., are building an addition to their plant to accommodate a new machine shop, which will be built to handle the manufacture of filing systems. Roy McMullen, who is mechanical superintendent of the Crown Furniture Co., informed this paper that they would be in the market within the next two months for the following equipment: six turret lathes, an engine lathe, universal grinder, surface grinder, milling machine and some other small accessories.

---

One million pounds of copper has been imported by the Canada Wire and Cable Works, Leaside, Ont., from the Anaconda Mines, Montana, for the manufacture of wire.

---

The Vulcan Iron Works, Ltd., Winnipeg, have received the contract for the miscellaneous and ornamental iron work for the Technical School, Calgary. The general contractors are the J. McDiarmid Company.

# LET GERMANY WORRY OVER THE PAYING OF THE DEBT TO THE ALLIES

WRITING to Canadian Machinery, John S. Watts, M.E., of New Glasgow, N.S., says:

While I have not been requested to express an opinion upon the advisability or otherwise of trading with the enemy (the German is still in actual fact, although not legally so, our enemy), I am impelled to butt into the discussion because of my studied conviction that such trading will tend to our own undoing in the not far distant future.

The main argument brought forward by those who advocate resuming commercial relations with Germany is that unless we do so Germany will be unable to pay the reparation which is demanded from her. For the sake of argument, let us assume that this is correct. To get our indemnity then, we must purchase sufficient goods from Germany to permit them to repay to us the damages assessed against them, out of the profits on such sales. Taking the average net profit on the transactions at the comparatively high figure of 10 per cent., the Allies will be compelled to purchase goods in Germany to the value of at least ten times the amount of their claim against Germany, which would simply make Germany the workshop of the world and leave the rest of us without employment.

If we trade with Germany, there must perforce be profit in the trade for Germany, and if unrestricted trade is allowed we will soon have Germany again the menace to the peace of the world that she was in the years before 1914. It is impossible in the space of a short letter to prove this statement, but it will not, to any who have really studied the matter, need proof.

To those who are laboring under the delusion that the German will refrain from using any force at his command to steal the wealth of other countries, or that he is now, or ever has been, other than a predatory barbarian, with a penchant for stealing, I would recommend a study of the history of the Prussian people and of the writings of their statesmen.

Such a study will show that the Prussians, as far back as we can trace them in history, have always existed mainly by the plunder forcibly stolen from their weaker neighbors.

That they are a brutal people, cruel to those in their power and servile to those who are stronger.

That they intend to gather their strength again for another effort to conquer, we have their own statements to prove.

That they have shown no symptoms of repentance for the vile outrages and unspeakable abominations committed by them during the war, and will repeat them any time they are powerful enough to do so.

In conclusion I would suggest that we cease to worry over how they are to pay the indemnity, let the Hun do the worrying, and if we keep him under the control of superior force I am sure he will find a way to pay. Anyway, when a criminal is fined, the judge does not have to consider how the criminal is to finance the fine, it is up to the guilty party to find the money, as best he can, or suffer the penalty, and there is no reason why the greatest criminals of all time should be treated more leniently. Let us have at least the intelligence, after having been "once bit, to be twice shy."

---

# SCOTTISH SCRAP MARKET IS POOR

**Nearly All the Prices Are Lower Than Those Which Were Quoted Before the War**

Writing to Canadian Machinery on conditions of the scrap market in Scotland, James Johnstone & Son, 212A St. Vincent Street, Glasgow, state:

Since last writing you the market for scrap has completely collapsed, owing largely to competition from the Continent. The iron and steel works here have very few orders on hand, and several of the leading works have not melted anything this year, and the others are only working a small proportion of their furnaces. Consequently the only buyers of scrap are some merchants who are inclined to buy in the hope that prices will advance later on. Present prices are as follows:

| | Per ton |
|---|---|
| Heavy mild steel melting scrap | £3 0 0 |
| Heavy wrought iron scrap | £4 0 0 |
| Heavy steel turnings | £1 15 0 |
| Cast iron borings | £1 0 0 |
| Heavy machinery metal | £7 0 0 |
| Light metal | £4 10 0 |

Nearly all of these prices are lower than they were before the war. Very few transactions are now taking place and only for small quantities.
